## Overview

- Equivalence Relations and Partitions
- Modular Arithmetic
- Another Construction of Number Domains

## Equivalence Relations and Partitions

## Relation Properties

**Definition:** A binary relation  $R$  on a set  $S$  is **reflexive**, **symmetric**, respectively **transitive**, if it satisfies the following properties:

$R$  is reflexive on  $S : \Leftrightarrow$

$$\forall x \in S : \langle x, x \rangle \in R;$$

$R$  is symmetric on  $S : \Leftrightarrow$

$$\forall x, y : \langle x, y \rangle \in R \Rightarrow \langle y, x \rangle \in R;$$

$R$  is transitive on  $S : \Leftrightarrow$

$$\forall x, y, z : (\langle x, y \rangle \in R \wedge \langle y, z \rangle \in R) \Rightarrow \langle x, z \rangle \in R.$$

**Example:** equality is reflexive, symmetric and transitive on every set.

## Equivalence Relation

**Definition:** Let  $R$  be a binary relation on  $S$ .  $R$  is an **equivalence relation** on  $S$ , if it is reflexive, symmetric, and transitive on  $S$ :

$$\begin{aligned} R \text{ is equivalence relation on } S &:\Leftrightarrow \\ R &\subseteq S \times S \wedge \\ R &\text{ is reflexive on } S \wedge \\ R &\text{ is symmetric on } S \wedge \\ R &\text{ is transitive on } S. \end{aligned}$$

Many (not all) properties of the equality relation on  $S$ .

## Visualization

- **Reflexivity:** every node has an arrow to itself,
- **Symmetry:** if there is an arrow from node  $a$  to node  $b$ , then there is also an arrow from  $b$  to  $a$ ,
- **Transitivity:** if there is an arrow from node  $a$  to node  $b$  and an arrow from  $b$  to some node  $c$ , then there is an arrow from  $a$  to  $c$ .

## Example

- $p(x, y) :\Leftrightarrow x + y$  is even

Equivalence relation on  $\mathbb{N}$ .

- $r(x, y) :\Leftrightarrow x_0 + y_1 = x_1 + y_0$

Equivalence relation on  $\mathbb{R} \times \mathbb{R}$ .

- $s(x, y) :\Leftrightarrow x$  is parallel to (or coincides with)  $y$

Equivalence relation on the set of all lines in the plane.

- $t(x, y) :\Leftrightarrow x$  has the same age as  $y$

Equivalence relation on the set of all people.

## Proof

We prove  $p(x, y) : \Leftrightarrow x + y$  is even is an equivalence relation on  $\mathbb{N}$ .

1.  $p$  is clearly a binary relation on  $\mathbb{N}$ .
2.  $p$  is reflexive on  $\mathbb{N}$ : Take arbitrary  $x \in \mathbb{N}$ . We have to show  $x + x$  is even, i.e,  $2x$  is even.
3.  $p$  is symmetric on  $\mathbb{N}$ : Take  $x \in \mathbb{N}$ ,  $y \in \mathbb{N}$ . We assume  $x + y$  is even. Then  $y + x$  is even.
4.  $p$  is transitive on  $\mathbb{N}$ : Take arbitrary  $x \in \mathbb{N}$ ,  $y \in \mathbb{N}$ , and  $z \in \mathbb{N}$ . We assume

$$(1) \ x + y \text{ is even} \wedge y + z \text{ is even}.$$

We have to show (2)  $x + z$  is even. From (1), we have some  $a \in \mathbb{N}$  and  $b \in \mathbb{N}$  such that

$$(3) \ 2a = x + y \wedge 2b = y + z.$$

Thus we know (2) because of

$$x + z = (x + y) + (y + z) - 2y = 2a + 2b - 2y = 2(a + b - y).$$

## Class

**Definition:** The **class** of  $x$  with respect to  $R$  is the set of all elements that are related to  $x$  by  $R$ :

$$[x]_R := \{y \in \text{range}(R) : \langle x, y \rangle \in R\}.$$

- We may just write  $[x]$ , if  $R$  is clear from the context.
- If  $R$  is an equivalence relation, we call  $[x]_R$  the **equivalence class** of  $x$  with respect to  $R$ .

## Visualization

The equivalence class of a node  $x$  is the set of all nodes to which  $x$  is (directly or indirectly) connected.

## Example

Let  $p \subseteq \mathbb{N} \times \mathbb{N}$  such that  $p(x, y) \Leftrightarrow x + y$  is even. Then we have

$$\begin{aligned} [0]_p &= \{0, 2, 4, 6, 8, 10, \dots\}, \\ [1]_p &= \{1, 3, 5, 7, 9, 11, \dots\}, \\ [2]_p &= \{0, 2, 4, 6, 8, 10, \dots\}, \\ [3]_p &= \{1, 3, 5, 7, 9, 11, \dots\}, \\ [4]_p &= \{0, 2, 4, 6, 8, 10, \dots\}, \\ &\dots \end{aligned}$$

We see that  $[0]_p \cup [1]_p = \mathbb{N}$  and  $[0]_p \cap [1]_p = \emptyset$ .

## Example

Let  $q \subseteq \mathbb{N} \times \mathbb{N}$  such that  $q(x, y) \Leftrightarrow x \bmod 5 = y \bmod 5$ . We have

$$[0]_q = \{0, 5, 10, 15, 20, 25, \dots\},$$

$$[1]_q = \{1, 6, 11, 16, 21, 26, \dots\},$$

$$[2]_q = \{2, 7, 12, 17, 22, 27, \dots\},$$

$$[3]_q = \{3, 8, 13, 18, 23, 28, \dots\},$$

$$[4]_q = \{4, 9, 14, 19, 24, 29, \dots\},$$

$$[5]_q = \{0, 5, 10, 15, 20, 25, \dots\},$$

...

We see that  $[0]_q \cup [1]_q \cup [2]_q \cup [3]_q \cup [4]_q = \mathbb{N}$  and that any two of these sets are disjoint.

## Example

Let  $r \subseteq (\mathbb{R} \times \mathbb{R}) \times (\mathbb{R} \times \mathbb{R})$  such that  $r(x, y) \Leftrightarrow x_0 + x_1 = y_0 + y_1$ .

$$[a]_r = \{b \in \mathbb{R} \times \mathbb{R} : a_0 + a_1 = b_0 + b_1\}$$

$$[a]_r = \{b \in \mathbb{R} \times \mathbb{R} : b_1 = -b_0 + (a_0 + a_1)\}$$

$[a]_r$  denotes the line with slope  $-1$  that goes through  $a$ :

## Example (Continued)

$$\mathbb{R} \times \mathbb{R} = \bigcup_{a \in \mathbb{R} \times \mathbb{R}} [a]_r$$

The plane is partitioned into the set of all these lines:

We can determine a “canonical representative” for each such line:

$$\mathbb{R} \times \mathbb{R} = \bigcup_{y \in \mathbb{R}} [\langle 0, y \rangle]_r$$

## Class Properties

**Proposition:** Let  $R$  be an equivalence relation on  $S$ .  $[x]_R$  contains  $x$ , for every  $x \in S$ :

$$\forall S, R : R \text{ is equivalence relation on } S \Rightarrow \forall x \in S : x \in [x]_R.$$

Let  $x$  and  $y$  be elements of  $S$ . The equivalence classes of  $x$  and  $y$  with respect to  $R$  are either identical or disjoint:

$$\begin{aligned} \forall S, R : R \text{ is equivalence relation on } S \Rightarrow \\ \forall x \in S, y \in S : \\ [x]_R = [y]_R \vee [x]_R \cap [y]_R = \emptyset. \end{aligned}$$

## Quotient Set

**Definition:** The **quotient set** of  $S$  with respect to  $R$  is the set of all classes induced on  $S$  by  $R$ :

$$S/R := \{[x]_R : x \in S\}.$$

By class properties, every set  $S$  is partitioned by an equivalence relation  $R$  into a set of non-empty and disjoint subsets (blocks).

## Partition

**Definition:**  $D$  is a **partition** or **decomposition** of  $S$ , if its elements, the **blocks**, are non-empty and disjoint and their union equals  $S$ :

$$\begin{aligned} D \text{ is partition of } S : &\Leftrightarrow \\ &(\forall x \in D : x \neq \emptyset) \wedge \\ &(\forall x \in D, y \in D : x = y \vee x \cap y = \emptyset) \wedge \\ &\bigcup D = S. \end{aligned}$$

## Example

- The set  $\{A, B, C\}$  is a partition of  $\mathbb{N}$ .

$$A := \{x \in \mathbb{N} : x \text{ is even}\},$$

$$B := \{x \in \mathbb{N} : x > 2 \wedge x \text{ is prime}\},$$

$$C := \{x \in \mathbb{N} : x \text{ is odd} \wedge x \text{ is not prime}\}.$$

- The set  $\{\text{circle}(r) : r \in \mathbb{R}_{\geq 0}\}$  is a partition of  $\mathbb{R} \times \mathbb{R}$ .

$$\text{circle}(r) := \{p \in \mathbb{R} \times \mathbb{R} : p_0^2 + p_1^2 = r^2\}.$$

## Equivalence Relations and Partitions

**Proposition:** Let  $R$  be an equivalence relation on  $S$ . The quotient set of  $S$  with respect to  $R$  is a partition of  $S$ :

$$\forall S, R : R \text{ is equivalence relation on } S \Rightarrow \\ S/R \text{ is partition of } S.$$

**Proof:** see lecture notes.

Every equivalence relation defines a partition.

## Partitions and Equivalence Relations

**Definition:** The relation induced by a partition  $D$  is the set of all pairs of elements of the same block of  $D$ :

$$x \sim_D y :\Leftrightarrow \exists d \in D : x \in d \wedge y \in d.$$

**Proposition:** Let  $D$  be a partition of  $S$ . The relation induced by  $D$  is an equivalence relation on  $S$ :

$$\forall S, D : D \text{ is partition of } S \Rightarrow \\ \sim_D \text{ is equivalence relation on } S.$$

**Every partition defines an equivalence relation.**

## Relationship between Constructions

**Proposition:** Let  $R$  be an equivalence relation on  $S$ . Then  $R$  is the relation induced by the quotient set of  $S$  with respect to  $R$ :

$$\forall S, R : R \text{ is equivalence relation on } S \Rightarrow \\ R = \sim_{S/R} .$$

Let  $D$  be a partition of  $S$ . Then  $D$  is the quotient set of the relation induced by  $D$ :

$$\forall S, D : D \text{ is partition of } S \Rightarrow \\ D = S / \sim_D .$$

Each construction is the inverse of the other.

# Modular Arithmetic

## Motivation

- $\mathbb{Z}$  has infinite size.

Infinitely many integers, no upper bound.

- Computer processors can only operate with finite subset.

On a 64 bit processor, only  $2^{64}$  integers, upper bound  $2^{32}$ .

- How deal with operation “overflows”?

$$2^{20} * 2^{30} = ?$$

Need domain for modeling processor arithmetic.

## Direct Approach

**Definition:** Let  $m \in \mathbb{Z}_{>0}$  and  $\mathbb{Z}_m := \{x \in \mathbb{Z} : 0 \leq x < m\}$ .

$$\begin{aligned} +_m : \mathbb{Z} \times \mathbb{Z} &\rightarrow \mathbb{Z}_m \\ x +_m y &:= (x + y) \bmod m \end{aligned}$$

$$\begin{aligned} -_m : \mathbb{Z} \times \mathbb{Z} &\rightarrow \mathbb{Z}_m \\ -_m x &:= (-x) \bmod m \end{aligned}$$

$$\begin{aligned} *_m : \mathbb{Z} \times \mathbb{Z} &\rightarrow \mathbb{Z}_m \\ x *_m y &:= (x * y) \bmod m \end{aligned}$$

## Example

Arithmetic modulo 3:

| $+_3$ | -4 | -3 | -2 | -1 | 0 | 1 | 2 | 3 | 4 |
|-------|----|----|----|----|---|---|---|---|---|
| -4    | 1  | 2  | 0  | 1  | 2 | 0 | 1 | 2 | 0 |
| -3    | 2  | 0  | 1  | 2  | 0 | 1 | 2 | 0 | 1 |
| -2    | 0  | 1  | 2  | 0  | 1 | 2 | 0 | 1 | 2 |
| -1    | 1  | 2  | 0  | 1  | 2 | 0 | 1 | 2 | 0 |
| 0     | 2  | 0  | 1  | 2  | 0 | 1 | 2 | 0 | 1 |
| 1     | 0  | 1  | 2  | 0  | 1 | 2 | 0 | 1 | 2 |
| 2     | 1  | 2  | 0  | 1  | 2 | 0 | 1 | 2 | 0 |
| 3     | 2  | 0  | 1  | 2  | 0 | 1 | 2 | 0 | 1 |
| 4     | 0  | 1  | 2  | 0  | 1 | 2 | 0 | 1 | 2 |

| $*_3$ | -4 | -3 | -2 | -1 | 0 | 1 | 2 | 3 | 4 |
|-------|----|----|----|----|---|---|---|---|---|
| -4    | 1  | 0  | 2  | 1  | 0 | 2 | 1 | 0 | 2 |
| -3    | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 |
| -2    | 2  | 0  | 1  | 2  | 0 | 1 | 2 | 0 | 1 |
| -1    | 1  | 0  | 2  | 1  | 0 | 2 | 1 | 0 | 2 |
| 0     | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 |
| 1     | 2  | 0  | 1  | 2  | 0 | 1 | 2 | 0 | 1 |
| 2     | 1  | 0  | 2  | 1  | 0 | 2 | 1 | 0 | 2 |
| 3     | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 |
| 4     | 2  | 0  | 1  | 2  | 0 | 1 | 2 | 0 | 1 |

Same pattern is repeated every 3 lines and every 3 columns.

## Observation

- Same pattern repeated every  $m$  lines and every  $m$  columns.
- Does not matter whether we compute with  $a$  or with

$$a + m,$$

$$a - m,$$

$$a + im, \text{ for any } i \in \mathbb{Z}.$$

- The elements of the set

$$[a]_m := \{a + im : i \in \mathbb{Z}\}$$

cannot be distinguished from  $a$  by arithmetic modulo  $m$ .

Can define modular arithmetic by equivalence classes.

## Modular Congruence

**Definition:** Two integers  $x$  and  $y$  are **congruent** modulo  $m$  if they have the same remainder when divided by  $m$ :

$$x \equiv_m y :\Leftrightarrow (x \bmod m) = (y \bmod m).$$

**Proposition:**  $\equiv_m$  is an equivalence relation, for every  $m \in \mathbb{Z}_{>0}$ .

## Residue Class

**Definition:** The **residue class** of  $a$  modulo  $m$  is the set of all integer numbers that are congruent to  $a$  modulo  $m$ .

$$[a]_m := [a]_{\equiv_m}.$$

**Proposition:**  $[a]_m = \{a + im : i \in \mathbb{Z}\}$ , for every  $a \in \mathbb{Z}, m \in \mathbb{Z}_{>0}$ .

- $\equiv_m$  defines the  $[a]_m$  of our intuition.
- $\equiv_m$  also defines a suitable domain  $\mathbb{Z}_m$  for modular arithmetic.

## Modular Integer Numbers

**Definition:** The set of integers modulo  $m$  is the quotient set of  $\mathbb{Z}$  with respect to congruence modulo  $m$ :

$$\mathbb{Z}_m := \mathbb{Z} / \equiv_m .$$

**Proposition:**  $\mathbb{Z}_m$  has  $m$  elements each of which is represented by a natural number less than  $m$ , i.e.,

$$\mathbb{Z}_m = \{[0]_m, [1]_m, [2]_m, \dots, [m-1]_m\}.$$

## Congruence Properties

**Proposition:** Let  $a$  and  $a'$  be in the same residue class and also  $b$  and  $b'$  be in the same residue class. The result of any integer operation involving  $a$  and  $b$  is in the same residue class as if the operation were performed with  $a'$  and  $b'$  instead:

$$\begin{aligned} \forall m \in \mathbb{Z}_{>0}, a \in \mathbb{Z}, a' \in \mathbb{Z}, b \in \mathbb{Z}, b' \in \mathbb{Z} : \\ [a]_m = [a']_m \wedge [b]_m = [b']_m \Rightarrow \\ [a + b]_m = [a' + b']_m \wedge \\ [-a]_m = [-a']_m \wedge \\ [a * b]_m = [a' * b']_m. \end{aligned}$$

## Example

We have  $[7]_5 = [2]_5$  and  $[9]_5 = [4]_5$ . Consequently,

$$[7 + 9]_5 = [2 + 4]_5 = [6]_5 = [1]_5.$$

When dealing with e.g.

$$[3]_5 = \{\dots, -7, -2, 3, 8, 13, \dots\}$$

we need not take the “canonical” representative 3 but may also choose  $-2$  or  $8$  as the representative for computation.

## Modular Arithmetic

Let  $m \in \mathbb{Z}_{>0}$  and define the selector function

$$\overline{x} := \mathbf{such} \ a \in \mathbb{Z} : x = [a]_m.$$

$$+_m : \mathbb{Z}_m \times \mathbb{Z}_m \rightarrow \mathbb{Z}_m$$

$$x +_m y := [\overline{x} +_{\mathbb{Z}} \overline{y}]_m$$

$$-_m : \mathbb{Z}_m \rightarrow \mathbb{Z}_m$$

$$-_m x := [-_{\mathbb{Z}} \overline{x}]_m$$

$$*_m : \mathbb{Z}_m \times \mathbb{Z}_m \rightarrow \mathbb{Z}_m$$

$$x *_m y := [\overline{x} *_{\mathbb{Z}} \overline{y}]_m$$

## Equivalent Definition

$$\begin{aligned} +_m &: \mathbb{Z}_m \times \mathbb{Z}_m \rightarrow \mathbb{Z}_m \\ [a]_m +_m [b]_m &:= [a +_{\mathbb{Z}} b]_m \end{aligned}$$

$$\begin{aligned} -_m &: \mathbb{Z}_m \rightarrow \mathbb{Z}_m \\ -_m[a]_m &:= [-_{\mathbb{Z}} a]_m \end{aligned}$$

$$\begin{aligned} *_m &: \mathbb{Z}_m \times \mathbb{Z}_m \rightarrow \mathbb{Z}_m \\ [a]_m *_m [b]_m &:= [a *_{\mathbb{Z}} b]_m \end{aligned}$$

Because of congruence properties, functions are uniquely defined.

## Operational Interpretation

For performing arithmetic on some  $x \in \mathbb{Z}_m$ ,

1. we apply the selector function to determine a representative  $\bar{x} \in \mathbb{Z}$ ,
2. perform the corresponding operation in  $\mathbb{Z}$  to yield the result  $r \in \mathbb{Z}$ ,
3. and then determine the residue class  $[r]_m \in \mathbb{Z}_m$ .

Because of congruence, choice of the representative does not matter.

## Example

We consider arithmetic in  $\mathbb{Z}_5 = \{[0]_5, [1]_5, [2]_5, [3]_5, [4]_5\}$ .

$$[17]_5 +_5 [24]_5 = [2]_5 +_5 [4]_5 = [6]_5 = [1]_5$$

$$[7]_5 -_5 [10]_5 = [2]_5 -_5 [0]_5 = [3]_5$$

$$[-7]_5 = [3]_5$$

$$[6]_5 *_5 [9]_5 = [1]_5 *_5 [4]_5 = [4]_5$$

$$[-3]_5 *_5 [6]_5 = [2]_5 *_5 [1]_5 = [2]_5$$

## **Another Construction of Number Domains**

## Direct Definition of Integer Numbers

- Integer as a tuple  $\langle x, y \rangle$ .
- Difference between  $x$  and  $y$  denotes desired value.
- For unique definition,  $x$  or  $y$  is chosen 0.
- Constructor function  $I$  to build well-formed integers.

More elegant: integer as class of all  $\langle x, y \rangle$  with same difference.

## Integer Domain

**Definition:** Set of integer numbers  $\mathbb{Z}$ :

$$x \sim_{\mathbb{Z}} y :\Leftrightarrow (x_0 +_{\mathbb{N}} y_1 = y_0 +_{\mathbb{N}} x_1)$$

$$\mathbb{Z} := (\mathbb{N} \times \mathbb{N}) / \sim_{\mathbb{Z}}$$

Partitioning of  $\mathbb{N} \times \mathbb{N}$  by equivalence relation.

## Integer Arithmetic

$$0 := [\langle 0_{\mathbb{N}}, 0_{\mathbb{N}} \rangle]; \quad 1 := [\langle 1_{\mathbb{N}}, 0_{\mathbb{N}} \rangle]; \quad 2 := [\langle 2_{\mathbb{N}}, 0_{\mathbb{N}} \rangle]$$

$$\bar{x} := \mathbf{such} \ a \in \mathbb{N} \times \mathbb{N} : x = [a]$$

$$x + y := [\langle \bar{x}_0 +_{\mathbb{N}} \bar{y}_0, \bar{x}_1 +_{\mathbb{N}} \bar{y}_1 \rangle]$$

$$-x := [\langle \bar{x}_1, \bar{x}_0 \rangle]$$

$$x - y := [\langle \bar{x}_0 +_{\mathbb{N}} \bar{y}_1, \bar{y}_0 +_{\mathbb{N}} \bar{x}_1 \rangle]$$

$$x * y := [\langle (\bar{x}_0 *_{\mathbb{N}} \bar{y}_0) +_{\mathbb{N}} (\bar{x}_1 *_{\mathbb{N}} \bar{y}_1), (\bar{x}_0 *_{\mathbb{N}} \bar{y}_1) +_{\mathbb{N}} (\bar{x}_1 *_{\mathbb{N}} \bar{y}_0) \rangle]$$

$$x \leq y :\Leftrightarrow \bar{x}_0 + \bar{y}_1 \leq_{\mathbb{N}} \bar{y}_0 + \bar{x}_1$$

Since  $\sim_{\mathbb{Z}}$  is a congruence relation, functions are uniquely defined.

## Example

$$\begin{aligned}
 5 &= [\langle 7, 2 \rangle] = \{ \langle 5, 0 \rangle, \langle 6, 1 \rangle, \langle 7, 2 \rangle, \langle 8, 3 \rangle, \dots \} \\
 -6 &= [\langle 3, 9 \rangle] = \{ \langle 0, 6 \rangle, \langle 1, 7 \rangle, \langle 2, 8 \rangle, \langle 3, 9 \rangle, \dots \} \\
 5 + (-6) &= [\langle 7, 2 \rangle] + [\langle 3, 9 \rangle] = [\langle 10, 11 \rangle] = [\langle 0, 1 \rangle] = -1 \\
 5 * (-6) &= [\langle 7, 2 \rangle] * [\langle 3, 9 \rangle] = [\langle 39, 69 \rangle] = [\langle 0, 30 \rangle] = -30 \\
 5 \leq -6 &\Leftrightarrow [\langle 7, 2 \rangle] \leq [\langle 3, 9 \rangle] \Leftrightarrow 16 \leq 5 \Leftrightarrow \text{F.}
 \end{aligned}$$

## Isomorphism of Integer Constructions

**Proposition:** Let  $\mathbb{Z}'$  denote the old construction of the integers and  $\mathbb{Z}$  denote the new one. The function  $i : \mathbb{Z}' \rightarrow \mathbb{Z}$

$$i(x) := [x]$$

is an isomorphism with respect to  $0, +, -, *, <$ , i.e.,  $i$  is bijective and for all  $x \in \mathbb{Z}'$  and  $y \in \mathbb{Z}'$ , we have:

$$\begin{aligned} i(0_{\mathbb{Z}'} ) &= 0_{\mathbb{Z}}, \\ i(x +_{\mathbb{Z}'} y) &= i(x) +_{\mathbb{Z}} i(y), \\ i(-_{\mathbb{Z}'} x) &= -_{\mathbb{Z}} i(x), \\ i(x -_{\mathbb{Z}'} y) &= i(x) -_{\mathbb{Z}} i(y), \\ &\dots \end{aligned}$$

**Inverse Isomorphism:**  $j : \mathbb{Z} \rightarrow \mathbb{Z}', j(x) := I(\overline{x})$

## Rational Numbers

**Definition:** Set of rational numbers  $\mathbb{Q}$ :

$$x \sim_{\mathbb{Q}} y :\Leftrightarrow (x_0 *_{\mathbb{Z}} y_1 = y_0 *_{\mathbb{Z}} x_1)$$

$$\mathbb{Q} := (\mathbb{Z} \times \mathbb{Z}_{\neq 0}) / \sim_{\mathbb{Q}}$$

**Arithmetic:** see lecture notes.

## Isomorphism of Rational Constructions

**Proposition:** Let  $\mathbb{Q}'$  denote the old construction of the integers and  $\mathbb{Q}$  denote the new one. The function  $i : \mathbb{Q}' \rightarrow \mathbb{Q}$

$$i(x) := [x]$$

is an isomorphism with respect to  $0, +, -, *, ', <$ , i.e.,  $i$  is bijective and for all  $x \in \mathbb{Q}'$  and  $y \in \mathbb{Q}'$ , we have:

$$\begin{aligned} i(0_{\mathbb{Q}'} ) &= 0_{\mathbb{Q}}, \\ i(x +_{\mathbb{Q}'} y) &= i(x) +_{\mathbb{Q}} i(y), \\ i(-_{\mathbb{Q}'} x) &= -_{\mathbb{Q}} i(x), \\ i(x -_{\mathbb{Q}'} y) &= i(x) -_{\mathbb{Q}} i(y), \\ &\dots \end{aligned}$$

**Inverse Isomorphism:**  $j : \mathbb{Q} \rightarrow \mathbb{Q}', j(x) := \frac{\overline{x_0}}{\overline{x_1}}$ .

## Summary

- Equivalence relations, classes, and partitions.
  - Every equivalence class is a partition.
  - Every partition is an equivalence class.
- Modular arithmetic and number domains.
  - Partitioning of basic domain by equivalence relation.
  - Computation with representative.
  - Because of congruence properties, choice of representative does not matter.
