#### Abstract

We show that a set of monic polynomials in the free Lie superalgebra is a Gröbner-Shirshov basis for a Lie superalgebra if and only if it is a Gröbner-Shirshov basis for its universal enveloping algebra. We investigate the structure of GröbnerShirshov bases for Kac-Moody superalgebras and give explicit constructions of Gröbner-Shirshov bases for classical Lie superalgebras.

[^0]
## 1 Introduction

Let $\mathcal{A}$ be a free (commutative, associative, or Lie) algebra over a field $k$, let $S \subset \mathcal{A}$ be a set of relations in $\mathcal{A}$, and let $\langle S\rangle$ be the ideal of $\mathcal{A}$ generated by $S$. One of the fundamental problems in the theory of abstract algebras is the reduction problem: given an element $f \in \mathcal{A}$, one would like to find a reduced expression for $f$ with respect to the relations in $S$. One of the most common approaches to this problem is to find another set of generators for the relations in $S$ that can replace the original relations so that one can get an effective algorithm for the reduction problem. More precisely, if one can find a set $S^{c}$ of generators of the ideal $\langle S\rangle$ which is closed under a certain composition of relations in $S$, then there exists an easy criterion by which one can determine whether an element $f \in \mathcal{A}$ is reduced with respect to $S$ or not.

In 1965 , inspired by Gröbner's suggestion, Buchberger found a criterion and an algorithm of computing such a set of generators of the ideals for commutative algebras [16], which were modified and refined in [17] and [18]. Such a set of generators of ideals is now referred to as a Gröbner basis, and it has become one of the most popular research topics in the theory of commutative algebras (see for example, [3]). In 1978, Bergman developed the theory of Gröbner bases for associative algebras by proving the Diamond Lemma [4]. His idea is a generalization of Buchberger's theory and it has many applications to various areas of the theory of associative algebras such as quantum groups.

For the case of Lie algebras, where the situation is more complicated than commutative or associative algebras, the parallel theory of Gröbner basis was developed by Shirshov in 1962 [30], which is even earlier than Buchberger's discovery. In that paper, which was written in Russian and never translated in English, he introduced the notion of composition of elements of a free Lie algebra and showed that a set of relations which is closed under the composition has the desired property. Shirshov's idea is essentially the same as that of Buchberger, and it was noticed by Bokut that Shirshov's method works for associative algebras as well [7]. For this reason, we will call such a set of relations of a free Lie algebra (and of a free associative algebra) a Gröbner-Shirshov basis. (See [2] for a more detailed history of Gröbner-Shirshov basis.) It has been used to determine the solvability of some word problems [29, 30, 6] and to prove some embedding theorems [55. [7, [8]. Recently, in a series of works by Bokut, Klein, and Malcolmson, Gröbner-Shirshov bases for finite dimensional simple Lie algebras and the quantized enveloping algebra of type $A_{n}$ were constructed explicitly ( [9, 10, 11, [4]).

In this work, we develop the theory of Gröbner-Shirshov bases for Lie superalgebras and their universal enveloping algebras. This paper is organized as follows. In Section 2,
after introducing the basic facts such as super-Lyndon-Shirshov words (monomials) and Composition Lemma, we prove that a set of monic polynomials in the free Lie superalgebra is a Gröbner-Shirshov basis for a Lie superalgebra if and only if it is a Gröbner-Shirshov basis for its universal enveloping algebra (Theorem 2.8). This is a generalization of the corresponding result for Lie algebras obtained in [15]. Thus the theory of Gröbner-Shirshov bases for Lie superalgebras and that of associative algebras are unified in this way, and as a by-product, we obtain a purely combinatorial proof of the Poincaré-Birkhoff-Witt Theorem (Proposition 2.11).

In section 3, we investigate the structure of Gröbner-Shirshov bases for Kac-Moody superalgebras and prove that, in order to find a Gröbner-Shirshov basis for a Kac-Moody superalgebra, it suffices to consider the completion of Serre relations of the positive part (or negative part) which is closed under the composition (Theorem 3.5). As a corollary, we obtain the triangular decomposition of Kac-Moody superalgebras and their universal enveloping algebras (Corollary 3.6). Our result in this section is a generalization of the corresponding result for Kac-Moody algebras obtained in [14].

Finally, in Section 4, we give an explicit construction of Gröbner-Shirshov bases for classical Lie superalgebras. The outline of our construction can be described as follows. We first start with a Kac-Moody superalgebra which is isomorphic to a given classical Lie superalgebra. Using the supersymmetry and Jacobi identity, we expand the set of Serre relations to a complete set $R$ of relations which is closed under the composition and determine the set $B$ of $R$-reduced super-Lyndon-Shirshov monomials. Now comparing the number of elements of $B$ with the dimension of the corresponding classical Lie superalgebra, we conclude that the set $R$ is indeed a Gröbner-Shirshov basis.

The main part of this work was completed while the first and the second authors were visiting Korea Institute for Advanced Study in the winter of 1998. We would like to express our sincere gratitude to Hyo-Chul Myung, Efim Zelmanov and the other members of Korea Institute for Advanced Study for their hospitality and cooperation.

## 2 Gröbner-Shirshov bases for Lie superalgebras

Let $X=X_{\overline{0}} \cup X_{\overline{1}}$ be a $\mathbb{Z}_{2}$-graded set with a linear ordering $\prec$, and let $X^{*}$ (resp. $X^{\#}$ ) be the semigroup of associative words on $X$ (resp. the groupoid of nonassociative words on $X)$. Then the semigroup $X^{*}$ (resp. the groupoid $X^{\#}$ ) has the $\mathbb{Z}_{2}$-grading $X^{*}=X_{0}^{*} \oplus X_{1}^{*}$ (resp. $X^{\#}=X_{\overline{0}}^{\#} \oplus X_{\overline{1}}^{\#}$ ) induced by that of $X$. The elements of $X_{\overline{0}}^{*}$ and $X_{\overline{0}}^{\#}$ (resp. $X_{\overline{1}}^{*}$ and $X_{\overline{1}}^{\#}$ ) are called even (resp. odd).

We denote by $l(u)$ the length of a word $u$ and the empty word will be denoted by 1 . For an associative word $u \in X^{*}$, we can choose a certain arrangement of brackets on $u$, which will be denoted by $(u)$. Conversely, there is a canonical bracket removing homomorphism $\rho: X^{\#} \rightarrow X^{*}$ given by $\rho((u))=u$ for $u \in X^{*}$.

We consider two linear orderings $<$ and $\ll$ on $X^{*}$ defined as follows:
(i) $u<1$ for any nonempty word $u$; and inductively, $u<v$ whenever $u=x_{i} u^{\prime}$, $v=x_{j} v^{\prime}$ and $x_{i} \prec x_{j}$ or $x_{i}=x_{j}$ and $u^{\prime}<v^{\prime}$.
(ii) $u \ll v$ if $l(u)<l(v)$ or $l(u)=l(v)$ and $u<v$.

The ordering $<$ (resp. $\ll$ ) is called the lexicographical ordering (resp. length-lexicographical ordering). We define the orderings $<$ and $\ll$ on $X^{\#}$ by (i) $u<v$ if and only if $\rho(u)<\rho(v)$, and (ii) $u \ll v$ if and only if $\rho(u) \ll \rho(v)$.

A nonempty word $u$ is called a Lyndon-Shirshov word if $u \in X$ or $v w>w v$ for any decomposition of $u=v w$ with $v, w \in X^{*}$. A nonempty word $u$ is called a super-Lyndon-Shirshov word if either it is a Lyndon-Shirshov word or it has the form $u=v v$ with $v$ a Lyndon-Shirshov word in $X_{\overline{1}}^{*}$. A nonempty nonassociative word $u$ is called a Lyndon-Shirshov monomial if either $u$ is an element of $X$ or
(i) if $u=u_{1} u_{2}$, then $u_{1}, u_{2}$ are Lyndon-Shirshov monomials with $u_{1}>u_{2}$,
(ii) if $u=\left(v_{1} v_{2}\right) w$ then $v_{2} \leq w$.

A nonempty nonassociative word $u$ is called a super-Lyndon-Shirshov monomial if either it is a Lyndon-Shirshov monomial or it has the form $u=v v$ with $v$ a Lyndon-Shirshov monomial in $X_{\overline{1}}^{\#}$.
Remark. In some literatures, the Lyndon-Shirshov words have been referred to as regular words, normal words, Lyndon words, etc. Since the definition of Lyndon-Shirshov words dates back to the works by Chen, Fox and Lyndon [19] and Shirshov [27], we decide to call them Lyndon-Shirshov words. The definition of super-Lyndon-Shirshov words can be found in [1], 24].

The following lemma asserts that there is a natural 1-1 correspondence between the set of super-Lyndon-Shirshov words and the set of super-Lyndon-Shirshov monomials.

Lemma 2.1 (11, 19, 24, 26]) If $u$ is a super-Lyndon-Shirshov monomial, then $\rho(u)$ is a super-Lyndon-Shirshov word. Conversely, for any super-Lyndon-Shirshov word $u$, there is a unique arrangement of brackets $[u]$ on $u$ such that $[u]$ is a super-Lyndon-Shirshov monomial.

Let $k$ be a field with $\operatorname{char}(k) \neq 2,3$, and let $\mathcal{A}_{X}$ be the free associative algebra generated by $X$ over $k$. The algebra $\mathcal{A}_{X}$ becomes a Lie superalgebra with the superbracket defined by

$$
[x, y]=x y-(-1)^{(\operatorname{deg} x)(\operatorname{deg} y)} y x
$$

for $x, y \in \mathcal{A}_{X}$. Let $\mathcal{L}_{X}$ be the subalgebra of $\mathcal{A}_{X}$ generated by $X$ as a Lie superalgebra. Then $\mathcal{L}_{X}$ is the free Lie superalgebra generated by $X$ over $k$. As we can see in the following theorem, there is a canonical linear basis for the free Lie superalgebra $\mathcal{L}_{X}$ :

Theorem 2.2 ([1], 19, 24, 26]) The set of super-Lyndon-Shirshov monomials form a linear basis of the free Lie superalgebra $\mathcal{L}_{X}$ generated by $X$.

Remark. The existence of linear bases for free Lie algebras of this form was first suggested by Hall [22, and later by Shirshov in a more general form (26, 28]). The linear basis for a free Lie superalgebra given in the above theorem will be called the Lyndon-Shirshov basis. It is a special case of the Hall-Shirshov basis.

Given a nonzero element $p \in \mathcal{A}_{X}$ we denote by $\bar{p}$ the maximal monomial appearing in $p$ under the ordering $\ll$. Thus $p=\alpha \bar{p}+\sum \beta_{i} w_{i}$ with $\alpha, \beta_{i} \in k, w_{i} \in X^{*}, \alpha \neq 0$ and $w_{i} \ll \bar{p}$. The coefficient $\alpha$ of $\bar{p}$ is called the leading coefficient of $p$ and $p$ is said to be monic if $\alpha=1$.

The following lemma plays a crucial role in defining the notion of Lie composition.
Lemma 2.3 (19, 24, 26]) Let $u$ and $v$ be super-Lyndon-Shirshov words such that $v$ is contained in $u$ as a subword. Write $u=a v b$ with $a, b \in X^{*}$. Then there is an arrangement of brackets $[u]=(a[v] b)$ on $u$ such that $[v]$ is a super-Lyndon-Shirshov monomial, $\overline{[u]}=u$ and the leading coefficient of $[u]$ is either 1 or 2.

Let $u=a v b$ be a super-Lyndon-Shirshov word, where $v$ is a super-Lyndon-Shirshov subword and $a, b \in X^{*}$. We define the bracket on $u$ relative to $v$, denoted by $[u]_{v}$, as follows:
(i) $[u]_{v}=(a[v] b)$ if the leading coefficient of $[u]$ is 1 ,
(ii) $[u]_{v}=\frac{1}{2}(a[v] b)$ if the leading coefficient of $[u]$ is 2 ,
where the arrangement of brackets [u] on $u$ is the one described in Lemma 2.3. Note that $[u]_{v}$ is monic and $\overline{[u]_{v}}=u$.

Similarly, if $p$ is a monic polynomial in the free Lie superalgebra $\mathcal{L}_{X}$ such that $\bar{p}$ is super-Lyndon-Shirshov, then we define the bracket on $u$ relative to $p$, denoted by $[u]_{p}$
to be the result of the substitution of $p$ instead of $\bar{p}$ in $[u]_{\bar{p}}$. Clearly, $[u]_{p}$ is monic and $\overline{[u]_{p}}=u$.

We now define the notion of associative composition of the elements in the free associative algebra $\mathcal{A}_{X}$ generated by $X$. Let $p, q$ be monic elements in $\mathcal{A}_{X}$ with leading terms $\bar{p}$ and $\bar{q}$. If there exist $a, b \in X^{*}$ such that $\bar{p} a=b \bar{q}=w$ with $l(\bar{p})>l(b)$, then we define the composition of intersection $(p, q)_{w}$ to be

$$
\begin{equation*}
(p, q)_{w}=p a-b q \tag{2.1}
\end{equation*}
$$

If there exist $a, b \in X^{*}$ such that $\bar{p}=a \bar{q} b=w$, then we define the composition of inclusion to be

$$
\begin{equation*}
(p, q)_{w}=p-a q b \tag{2.2}
\end{equation*}
$$

Note that we have $\overline{(p, q)_{w}} \ll w$ in either case.
Next we proceed to define the notion of Lie composition of the elements in the free Lie superalgebra $\mathcal{L}_{X}$ generated by $X$. Let $p, q$ be monic polynomials in the free Lie superalgebra $\mathcal{L}_{X}$ with leading terms $\bar{p}$ and $\bar{q}$. If there exist $a, b \in X^{*}$ such that $\bar{p} a=b \bar{q}=w$ with $l(\bar{p})>l(b)$, then we define the composition of intersection $\langle f, g\rangle_{w}$ to be

$$
\begin{equation*}
\langle f, g\rangle_{w}=[w]_{p}-[w]_{q} . \tag{2.3}
\end{equation*}
$$

If there exist $a, b \in X^{*}$ such that $\bar{p}=a \bar{q} b=w$, then we define the composition of inclusion to be

$$
\begin{equation*}
\langle p, q\rangle_{w}=p-[w]_{q} . \tag{2.4}
\end{equation*}
$$

We have $\overline{\langle p, q\rangle_{w}} \ll w$ in this case, too.

Remark. Our definition of Lie composition is essentially the same as the one given in [6, 23, 24, 29]. We modified the definition in [6, 23, 24, 29] to define the Lie composition $\langle p, q\rangle_{w}$ at one stroke.

Let $S$ be a set of monic polynomials in $\mathcal{L}_{X} \subset \mathcal{A}_{X}$, let $I$ be the (Lie) ideal generated by $S$ in the free Lie superalgebra $\mathcal{L}_{X}$, and let $J$ be the (associative) ideal generated by $S$ in the free associative algebra $\mathcal{A}_{X}$. We denote by $L=\mathcal{L}_{X} / I$ the Lie superalgebra generated by $X$ with defining relations $S$ and let $\mathcal{U}(L)=\mathcal{A}_{X} / J$ be its universal enveloping algebra.

For $f, g \in \mathcal{A}_{X}$ and $w \in X^{*}$, we write $f \equiv_{A} g \bmod (S, w)$ if $f-g=\sum \alpha_{i} a_{i} s_{i} b_{i}$, where $\alpha_{i} \in k, a_{i}, b_{i} \in X^{*}, s_{i} \in S$ with $a_{i} \overline{s_{i}} b_{i} \ll w$ for each $i$. Similarly, for $f, g \in \mathcal{L}_{X}$ and $w \in X^{*}$,
we write $f \equiv_{L} g \bmod (S, w)$ if $f-g=\sum \alpha_{i}\left(a_{i}\left(s_{i}\right) b_{i}\right)$, where $\alpha_{i} \in k, a_{i}, b_{i} \in X^{*}, s_{i} \in S$ with $\overline{p\left(a_{i}\left(s_{i}\right) b_{i}\right)} \ll w$ for each $i$. The set $S$ is said to be closed under the associative composition (resp. Lie composition) if for any $f, g \in S$, we have $(f, g)_{w} \equiv_{A} 0\left(\right.$ resp. $\langle f, g\rangle_{w} \equiv_{L} 0$ ) $\bmod (S, w)$.

A set of monic polynomials $S$ in the free Lie superalgebra $\mathcal{L}_{X}$ is called a GröbnerShirshov basis for the ideal $J$ (resp. for the ideal $I$ ) if it is closed under the associative composition (resp. Lie composition). By abuse of language, we will also refer to $S$ as a Gröbner-Shirshov basis for the associative algebra $\mathcal{U}(L)$ and for the Lie superalgebra $L$, respectively. An associative word $u$ is said to be $S$-reduced if $u \neq a \bar{s} b$ for any $s \in S$ and $a, b \in X^{*}$. A nonassociative word $u$ is said to be $S$-reduced if $\rho(u)$ is S-reduced.

The following lemma is a generalization of Lemma 1 in (9).

## Lemma 2.4

(a) Every nonempty word $u$ in the free associative algebra $\mathcal{A}_{X}$ can be written as

$$
\begin{equation*}
u=\sum \alpha_{i} u_{i}+\sum \beta_{j} a_{j} s_{j} b_{j} \tag{2.5}
\end{equation*}
$$

where $u_{i}$ is an $S$-reduced word, $\alpha_{i}, \beta_{j} \in k, a_{j}, b_{j} \in X^{*}, s_{j} \in S$ and $a_{j} \overline{s_{j}} b_{j} \overleftrightarrow{<} u$ for all $i, j$. Hence the set of $S$-reduced words spans the algebra $\mathcal{U}(L)$.
(b) Every super-Lyndon-Shirshov monomial $u$ in $\mathcal{L}_{X}$ can be written as

$$
\begin{equation*}
u=\sum \alpha_{i} u_{i}+\sum \beta_{j}\left(a_{j}\left(s_{j}\right) b_{j}\right) \tag{2.6}
\end{equation*}
$$

where $u_{i}$ is an $S$-reduced super-Lyndon-Shirshov monomial, $\alpha_{i}, \beta_{j} \in k, a_{j}, b_{j} \in X^{*}, s_{j} \in S$ and $\overline{\left(a_{j}\left(s_{j}\right) b_{j}\right)} \lll \bar{u}$ for all $i, j$. Hence the set of $S$-reduced super-Lyndon-Shirshov monomials spans the Lie superalgebra $L$.

Proof. Since the proof of (a) is similar to that of (b), we only give a proof of (b). If $u$ is S-reduced, we are done. Thus we assume that $\bar{u}=a \bar{s} b$ for some $s \in S, a, b \in X^{*}$. Then $\bar{u}$ and $\bar{s}$ are super-Lyndon-Shirshov words and $\overline{u-\alpha[\bar{u}]_{s}} \ll \bar{u}$ for some $\alpha \in k$. Since $u-\alpha[\bar{u}]_{s}$ is a linear combination of super-Lyndon-Shirshov monomials whose leading terms are less than $\bar{u}$, we may proceed by induction, which completes the proof.

The following lemma plays a crucial role in our discussion of Gröbner-Shirshov bases. It is originally due to Shirshov [30] and is now known as the Composition Lemma.

Lemma 2.5 (cf. [1, 6, 24, 30) If $S$ is a Gröbner-Shirshov basis for the ideal J, then for any $f \in J$, the word $\bar{f}$ contains a subword $\bar{s}$ with $s \in S$.

It is clear that if a polynomial $f \in \mathcal{L}_{X}$ satisfies $f \equiv_{L} 0 \bmod (S, w)$ for $w \in X^{*}$, then $f \equiv \equiv_{A} 0 \bmod (S, w)$. The converse is also true if $S$ is closed under the associative composition.

Lemma 2.6 Assume that $S$ is closed under the associative composition. If a polynomial $f \in \mathcal{L}_{X}$ satisfies $f \equiv_{A} 0 \bmod (S, w)$ for $w \in X^{*}$, then $f \equiv_{L} 0 \bmod (S, w)$.

Proof. Suppose $f \equiv{ }_{A} 0 \bmod (S, w)$ for $w \in X^{*}$ and our assertion holds for all $w^{\prime} \ll w$. Then $f \in J$, and by the Composition Lemma, $\bar{f}=a \bar{s} b$ for some $a, b \in X^{*}$ and $s \in S$. Since $f-[\bar{f}]_{s} \equiv_{A} 0 \bmod (S, \bar{f})$ and $\bar{f} \ll w$, our assertion follows by induction.

Lemma 2.7 Let $f, g \in S$ be monic polynomials in $\mathcal{L}_{X}$ such that the associative composition $(f, g)_{w}$ is defined. Then we have

$$
\begin{equation*}
(f, g)_{w} \equiv_{A}\langle f, g\rangle_{w} \quad \bmod (S, w) \tag{2.7}
\end{equation*}
$$

Proof. We consider the composition of intersection only. The proof for the composition of inclusion is similar. Recall that $[w]_{f}=f a+\sum \alpha_{i} a_{i} f b_{i}$ with $a_{i} \bar{f} b_{i} \ll w$ and $[w]_{g}=b g+\sum \beta_{i} c_{i} g d_{i}$ with $c_{i} \bar{g} d_{i} \ll w$. Thus $\langle f, g\rangle_{w}=[w]_{f}-[w]_{g}=f a-b g+h=(f, g)_{w}+h$, where $h \equiv_{A} 0 \bmod (S, w)$. Hence $(f, g)_{w} \equiv_{A}\langle f, g\rangle_{w} \bmod (S, w)$.

Combining Lemma 2.6 and Lemma 2.7, we obtain the main result of this section, which is a generalization of the main theorem in [15].

Theorem 2.8 Let $S$ be a set of monic polynomials in the free Lie superalgebra $\mathcal{L}_{X}$. Then $S$ is a Gröbner-Shirshov basis for the Lie superalgebra $L=\mathcal{L}_{X} / I$ if and only if $S$ is a Gröbner-Shirshov basis for its universal enveloping algebra $\mathcal{U}(L)=\mathcal{A}_{X} / J$. That is, $S$ is closed under the Lie composition if and only if it is closed under the associative composition.

The following proposition, which is a generalization of Proposition 2 in [9], provides us with a criterion for determining whether a set of monic polynomials in the free Lie superalgebra is a Gröbner-Shirshov basis or not.

## Proposition 2.9

(a) If the set of $S$-reduced words is a linear basis of $\mathcal{U}(L)=\mathcal{A}_{X} / J$, then $S$ is a Gröbner-Shirshov basis for the ideal $J$ of $\mathcal{A}_{X}$.
(b) If the set of $S$-reduced super-Lyndon-Shirshov monomials is a linear basis of $L=$ $\mathcal{L}_{X} / I$, then $S$ is a Gröbner-Shirshov basis for the ideal I of $\mathcal{L}_{X}$.

Proof. Since the proof of (b) is the same as (a), we will prove (a) only. Suppose on the contrary that $S$ is not closed under the associative composition. Then there exist $f, g \in S$ such that $(f, g)_{w} \not 三_{A} 0 \bmod (S, w)$ for $w \in X^{*}$. By Lemma 2.4, we may write

$$
(f, g)_{w}=\sum \alpha_{i} u_{i}+\sum \beta_{j} a_{j} s_{j} b_{j}
$$

where $\alpha_{i}, \beta_{j} \in k, u_{i}$ is S-reduced, $a_{j}, b_{j} \in X^{*}, s_{j} \in S$ and $a_{j} \overline{s_{j}} b_{j} \ll w$ for all $i$ and $j$. Since $(f, g)_{w} \not 三_{A} 0 \bmod (S, w)$, we have $\sum \alpha_{i} u_{i} \neq 0$ in $\mathcal{A}_{X}$. Since the set of S-reduced words is a linear basis of $\mathcal{U}(L)$, we have $\sum \alpha_{i} u_{i} \neq 0$ in $\mathcal{U}(L)$. But, since $(f, g)_{w} \in J$, we have $\sum \alpha_{i} u_{i}=0$ in $\mathcal{U}(L)$, which is a contradiction.

Conversely, by Lemma 2.4 and the Composition Lemma, we can show that a GröbnerShirshov basis gives rise to a linear basis for the corresponding algebras.

## Theorem 2.10

(a) If $S$ is a Gröbner-Shirshov basis for the Lie superalgebra $L=\mathcal{L}_{X} / I$, then the set of S-reduced super-Lyndon-Shirshov monomials forms a linear basis of L.
(b) If $S$ is a Gröbner-Shirshov basis for the universal enveloping algebra $\mathcal{U}(L)=\mathcal{A}_{X} / J$ of $L$, then the set of $S$-reduced words forms a linear basis of $\mathcal{U}(L)$.

Proof. Since the proof of (b) is similar to that of (a), we will prove (a) only. By Lemma 2.4 the set of $S$-reduced super-Lyndon-Shirshov monomials spans $L$. Assume that we have $\sum \alpha_{i} u_{i}=0$ in $L$, where $\alpha_{i} \in k$ and $u_{i}$ are distinct $S$-reduced super-Lyndon-Shirshov monomials. Then $\sum \alpha_{i} u_{i} \in I$ in the free Lie super algebra $\mathcal{L}_{X}$. Since $I \subset J$, we obtain $\sum \alpha_{i} u_{i} \in J$. By the Composition Lemma (Lemma 2.5) the leading term $\overline{\sum \alpha_{i} u_{i}}$ contains a subword $\bar{s}$ with $s \in S$. Since each $u_{i}$ is $S$-reduced, we must have $\alpha_{i}=0$ for all $i$. Hence the set of $S$-reduced super-Lyndon-Shirshov monomials is linearly independent.

As a corollary, we obtain a purely combinatorial proof of the Poincaré-Birkhoff-Witt Theorem.

## Proposition 2.11

Let $L=L_{\overline{0}} \oplus L_{\overline{1}}$ be a Lie superalgebra with a linear basis $Z=\left\{z_{1}, z_{2}, \ldots\right\}$ such that each $z_{i}$ is homogeneous with respect to the $\mathbb{Z}_{2}$-grading. Then a linear basis of the universal enveloping algebra $\mathcal{U}(L)$ of $L$ is given by the set of all elements of the form $z_{i_{1}} z_{i_{2}} \ldots z_{i_{n}}$ where $i_{k} \leq i_{k+1}$ and $i_{k} \neq i_{k+1}$ if $z_{i_{k}} \in L_{\overline{1}}$.

Proof. Let $Y=\left\{y_{1}, y_{2}, \ldots\right\}$ be a $\mathbb{Z}_{2}$-graded set identified with the set $Z$ by a map $\iota$ such that $\iota\left(y_{i}\right)=z_{i}$ and $\iota\left(Y_{\alpha}\right)=Z_{\alpha}$ with $\alpha \in \mathbb{Z}_{2}$. Let $\mathcal{L}_{Y}$ be the free Lie superalgebra generated by $Y$. Let $S \subset \mathcal{L}_{Y}$ be the set of elements of the form

$$
\left[y_{i} y_{j}\right]-\sum_{k} \alpha_{i j}^{k} y_{k}
$$

where $i \geq j$ and $i \neq j$ if $y_{i} \in Y_{\overline{0}}$, and $\alpha_{i j}^{k}$ is the structure constants given by the equation $\left[z_{i} z_{j}\right]=\sum_{k} \alpha_{i j}^{k} z_{k}$ in $L$. Let $I$ be the ideal of $\mathcal{L}_{Y}$ generated by $S$. Then, clearly, $\mathcal{L}_{Y} / I$ is isomorphic to $L$ and the set of $S$-reduced super-Lyndon-Shirshov monomials is just the set Y. By Proposition 2.9 the set $S$ is a Gröbner-Shirshov basis for $L$ and then by Theorem 2.8 the set $S$ is also a Gröbner-Shirshov basis for $\mathcal{U}(L)$. Now our assertion follows from Theorem 2.10.

Let $S$ be a set of relations in the free Lie superalgebra $\mathcal{L}_{X}$ generated by $X$. We will see how one can complete the set $S$ to get a Gröbner-Shirshov basis. For any subset $T$ of $\mathcal{L}_{X}$, we define $\widehat{T}=\{p / \alpha \mid \alpha \in k$ is the leading coefficient of $p \in T\}$. Let $S^{(0)}=\widehat{S}$ and $S_{(0)}=\left\{\langle f, g\rangle_{w} \not 三_{L} 0 \bmod \left(S^{(0)}, w\right) \mid f, g \in S^{(0)}\right\}$. For $i \geq 1$, set $S_{(i)}=\left\{\langle f, g\rangle_{w} \not \equiv_{L}\right.$ $\left.0 \bmod \left(S^{(i)}, w\right) \mid f, g \in S^{(i)}\right\}$ and $S^{(i)}=S^{(i-1)} \cup \widehat{S}_{(i-1)}$.

Then the set $S^{c}=\bigcup_{i \geq 0} S^{(i)}$ is a Gröbner-Shirshov basis for the (Lie) ideal I generated by $S$ in $\mathcal{L}_{X}$. Hence, by Lemma 2.7, it is also a Gröbner-Shirshov basis for the (associative) ideal $J$ generated by $S$ in $\mathcal{A}_{X}$. It is easy to see that if every element of $S$ is homogeneous in $x_{i} \in X$, then every element of $S^{c}$ is also homogeneous in $x_{i}$ 's.

## 3 Kac-Moody superalgebras

We now investigate the structure of Gröbner-Shirshov bases for Kac-Moody superalgebras. Our result is a generalization of the work by Bokut and Malcolmson (14) on the Gröbner-Shirshov bases for Kac-Moody algebras. In the section, since we will consider the associative congruences only, we will use the notation $\equiv$ in place of $\equiv_{A}$.

Let $\Omega=\{1,2, \ldots, r\}$ be a finite index set and $\tau$ be a subset of $\Omega$. A square matrix $A=\left(a_{i j}\right)_{i, j \in \Omega}$ is called a generalized Cartan Matrix if it satisfies:
(i) $a_{i i}=2$ or 0 for $i=1, \ldots, r$ and if $a_{i i}=0$, then $i \in \tau$,
(ii) if $a_{i i} \neq 0$, then $a_{i j} \in \mathbb{Z}_{\leq 0}$ for $i \neq j$,
(iii) $a_{i j}=0$ implies $a_{j i}=0$,
(iv) if $a_{i i}=2$ and $i \in \tau$, then $a_{i j} \in 2 \mathbb{Z}$.

Let $E=\left\{e_{i}\right\}_{i \in \Omega}, H=\left\{h_{i}\right\}_{i \in \Omega}, F=\left\{f_{i}\right\}_{i \in \Omega}$, and $X=E \cup H \cup F$. We define a $\mathbb{Z}_{2^{-}}$ grading on $\Omega$ by setting $\operatorname{deg} i=\overline{0}$ for $i \notin \tau$ and $\operatorname{deg} i=\overline{1}$ for $i \in \tau$, and on $X$ by $\operatorname{deg} e_{i}=\operatorname{deg} f_{i}=\operatorname{deg} i$ and $\operatorname{deg} h_{i}=\overline{0}$. We give a linear ordering on $X$ by $e_{i} \succ h_{j} \succ f_{k}$ for all $i, j, k \in \Omega$ and $e_{i} \succ e_{j}, h_{i} \succ h_{j}, f_{i} \succ f_{j}$ when $i>j$. Then we have the lexicographic ordering and length-lexicographic ordering as in Section 2. We denote the left adjoint action of a Lie algebra by ad and the right adjoint action by $\widetilde{\mathrm{ad}}$. The Kac-Moody superalgebra $\mathcal{G}=\mathcal{G}(A, \tau)$ associated to $(A, \tau)$ is defined to be the Lie superalgebra with generators $X$ and the following defining relations:

$$
\begin{align*}
W: & {\left[h_{i} h_{j}\right] \quad(i>j), } \\
& {\left[e_{i} f_{j}\right]-\delta_{i j} h_{i}, \quad\left[e_{j} h_{i}\right]+a_{i j} e_{j}, \quad\left[h_{i} f_{j}\right]+a_{i j} f_{j}, } \\
S_{+, 1}: & \left(\operatorname{ad} e_{i}\right)^{1-n_{i j}} e_{j} \quad(i>j), \\
& e_{i}\left(\widetilde{\mathrm{ad}} e_{j}\right)^{1-n_{j i}} \quad(i>j),  \tag{3.1}\\
S_{+, 2}: & {\left[\left[e_{k+1}, e_{k}\right]\left[e_{k}, e_{k-1}\right]\right] \quad \text { for } k \in \eta, } \\
S_{-, 1}: & \left(\operatorname{ad} f_{i}\right)^{1-n_{i j}} f_{j} \quad(i>j), \\
& f_{i} \widetilde{\left(\operatorname{ad} f_{j}\right)^{1-n_{j i}} \quad(i>j),} \\
S_{-, 2}: & {\left[\left[f_{k+1}, f_{k}\right]\left[f_{k}, f_{k-1}\right]\right] \quad \text { for } k \in \eta, }
\end{align*}
$$

where

$$
n_{i j}=\left\{\begin{array}{ll}
a_{i j} & \text { if } a_{i i}=2 \text { or } a_{i j}=0  \tag{3.2}\\
-1 & \text { if } a_{i i}=0 \text { and } a_{i j} \neq 0
\end{array} \quad \text { for } i \neq j\right.
$$

and $\eta$ is the set of indices $k$ such that $k \in \tau, k \pm 1 \notin \tau, a_{k k}=0, a_{k+1, k-1}=0$ and $a_{k, k+1}+a_{k, k-1}=0$. Let $S_{ \pm}=S_{ \pm, 1} \cup S_{ \pm, 2}$ and $S(A, \tau)=S_{+} \cup W \cup S_{-}$. We denote by $\mathcal{G}_{+}$ (resp. $\mathcal{G}_{0}$ and $\mathcal{G}_{-}$) the subalgebra of $\mathcal{G}$ generated by $E$ (resp. $H$ and $F$ ).

Set $t_{i j}=\left[e_{i} f_{j}\right]-\delta_{i, j} h_{i}$, which belong to the relations $W$. We define the differential substitution $\tilde{\partial}_{j}=\tilde{\partial}\left(e_{j} \rightarrow h_{j}\right)$ acting as a right superderivation on $\mathcal{A}_{E}$ by

$$
\begin{align*}
& \left(e_{i}\right) \tilde{\partial}_{j}=\delta_{i j} h_{j},  \tag{3.3}\\
& (u v) \tilde{\partial}_{j}=u(v) \tilde{\partial}_{j}+(-1)^{(\operatorname{deg} j)(\operatorname{deg} v)}(u) \tilde{\partial}_{j} v \quad \text { for } u, v \in \mathcal{A}_{E}
\end{align*}
$$

It is easy to prove that for any $p \in \mathcal{A}_{E}$,

$$
\begin{equation*}
p f_{j} \equiv(-1)^{(\operatorname{deg} p)(\operatorname{deg} j)} f_{j} p+(p) \tilde{\partial}_{j} \quad \bmod (W, w) \tag{3.4}
\end{equation*}
$$

for some $w \gg \bar{p} f_{j}$. Note that $\tilde{\partial}_{j}$ is also a right superderivation on $\mathcal{L}_{E}$.
Lemma 3.1 Let $p$ be a homogeneous monic element of $\mathcal{A}_{E}$ such that $\left(p, t_{i j}\right)_{w}$ is defined for $w \in X^{*}$. Then we have

$$
\left(p, t_{i j}\right)_{w} \equiv(p) \tilde{\partial}_{j} \quad \bmod (\{p\} \cup W, w)
$$

Proof. It suffices to consider the composition of intersection. We can write $p=\bar{p}+p^{\prime}$ with $\bar{p}=b e_{i}$, where all the terms of $p^{\prime}$ are lower than $\bar{p}$. Then $w=\bar{p} f_{j}=b e_{i} f_{j}$. Since $p$ is homogeneous, $\operatorname{deg} p=\operatorname{deg} p^{\prime}$. From (3.4), we have

$$
\begin{aligned}
\left(p, t_{i j}\right)_{w} & =p f_{j}-b\left(e_{i} f_{j}-(-1)^{(\operatorname{deg} i)(\operatorname{deg} j)} f_{j} e_{i}-\delta_{i j} h_{j}\right) \\
& =p^{\prime} f_{j}+(-1)^{(\operatorname{deg} i)(\operatorname{deg} j)} b f_{j} e_{i}+\delta_{i j} b h_{j} \\
& \equiv(-1)^{(\operatorname{deg} p)(\operatorname{deg} j)}\left(f_{j} p^{\prime}+f_{j} b e_{i}\right)+\left(p^{\prime}\right) \tilde{\partial}_{j} \\
& +(-1)^{(\operatorname{deg} i)(\operatorname{deg} j)}(b) \tilde{\partial}_{j} e_{i}+\delta_{i j} b h_{j} \\
& \equiv(-1)^{(\operatorname{deg} p)(\operatorname{deg} j)} f_{j} p+(p) \tilde{\partial}_{j} \\
& \equiv(p) \tilde{\partial}_{j} \quad \bmod (\{p\} \cup W, w) .
\end{aligned}
$$

In the rest of this paper, we shall omit brackets whenever it is convenient. Namely, the Lie product $[a, b]$ will be written as $a b$. Moreover, $(\operatorname{ad} x)^{n} y$ will be written as $x^{n} y$ and $x(\widetilde{\operatorname{ad}} y)^{n}$ as $x y^{n}$. It would be clear from the context whether a product $a b$ means a Lie product or not.

We write $f \equiv g \bmod (S, n)$ if $f-g=\sum \alpha_{i} a_{i} s_{i} b_{i}$ with $l\left(a_{i} \bar{s}_{i} b_{i}\right) \leq n$, where $n \in \mathbb{Z}_{>0}$, $\alpha_{i} \in k, a_{i}, b_{i} \in X^{*}$, and $s_{i} \in S$.

Lemma 3.2 Let $p \in S_{+}$. Then for any $l=1, \cdots, r$, we have

$$
(p) \tilde{\partial}_{l} \equiv 0 \quad \bmod \left(S_{+} \cup W, l(\bar{p})\right)
$$

Proof.
Case 1. Relation $S_{+, 1}$ :

Since $e_{i}^{1-n_{i j}} e_{j}=\alpha e_{j} e_{i}^{1-n_{i j}}$ with $\alpha \in k$, it suffices to prove our assertion for $p=e_{j} e_{i}^{1-n_{i j}}$ for $i \neq j$. We first consider the case when $a_{i i}=2$. We have only to check the cases when $l=i$ and $l=j$. If $l=i$, we have

$$
\begin{aligned}
(p) \tilde{\partial}_{i}= & \left(e_{j} e_{i}^{1-a_{i j}}\right) \tilde{\partial}_{i} \\
= & \left(e_{j} e_{i}^{-a_{i j}}\right) h_{i}+(-1)^{\operatorname{deg} i}\left(\left(e_{j} e_{i}^{-a_{i j}-1}\right) h_{i}\right) e_{i} \\
& +(-1)^{2 \operatorname{deg} i}\left(\left(e_{j} e_{i}^{-a_{i j}-2}\right) h_{i}\right) e_{i}^{2}+\cdots+(-1)^{-a_{i j} \operatorname{deg} i}\left(e_{j} h_{i}\right) e_{i}^{-a_{i j}} \\
\equiv & a_{i j} e_{j} e_{i}^{-a_{i j}}+(-1)^{\operatorname{deg} i}\left(a_{i j}-2\right) e_{j} e_{i}^{-a_{i j}} \\
& +(-1)^{2 \operatorname{deg} i}\left(a_{i j}-4\right) e_{j} e_{i}^{-a_{i j}}+\cdots+(-1)^{-a_{i j} \operatorname{deg} i}\left(-a_{i j}\right) e_{j} e_{i}^{-a_{i j}} .
\end{aligned}
$$

If $i \notin \tau$, then, clearly, the coefficient of $e_{j} e_{i}^{-a_{i j}}$ is 0 . If $i \in \tau$, then $a_{i j} \in 2 \mathbb{Z}$ by the assumption on the generalized Cartan matrix $A$, and hence the coefficient of $e_{j} e_{i}^{-a_{i j}}$ is also 0 .

Similarly, if $l=j$, we have

$$
\begin{aligned}
(p) \tilde{\partial}_{j} & =\left(e_{j} e_{i}^{1-a_{i j}}\right) \tilde{\partial}_{j}=(-1)^{\left(1-a_{i j}\right)(\operatorname{deg} i)(\operatorname{deg} j)} h_{j} e_{i}^{1-a_{i j}} \\
& \equiv(-1)^{\left(1-a_{i j}\right)(\operatorname{deg} i)(\operatorname{deg} j)} a_{j i} e_{i} e_{i}^{-a_{i j}}=0 .
\end{aligned}
$$

The proof for the case $a_{i i}=0$ is the same.
Case 2. Relation $S_{+, 2}$ :
Let $p=\left(e_{k+1} e_{k}\right)\left(e_{k} e_{k-1}\right)$ with $k \in \eta$. If $l=k-1$, since $\left(e_{k+1} e_{k}\right) e_{k}$ or $e_{k+1} e_{k}$ is in $S_{+}$, we have

$$
\begin{aligned}
(p) \tilde{\partial}_{k-1} & =\left(\left(e_{k+1} e_{k}\right)\left(e_{k} e_{k-1}\right)\right) \tilde{\partial}_{k-1}=\left(e_{k+1} e_{k}\right)\left(e_{k} h_{k-1}\right) \\
& \equiv-a_{k-1, k}\left(e_{k+1} e_{k}\right) e_{k} \\
& \equiv 0 \quad \bmod \quad\left(S_{+} \cup W, l(\bar{p})\right)
\end{aligned}
$$

Similarly, $(p) \tilde{\partial}_{k+1} \equiv 0 \quad \bmod \left(S_{+} \cup W, l(\bar{p})\right)$.
If $l=k$, since $a_{k, k-1}+a_{k, k+1}=0$ and $e_{k+1} e_{k-1} \in S_{+}$, we have

$$
\begin{aligned}
(p) \tilde{\partial}_{k} & =\left(\left(e_{k+1} e_{k}\right)\left(e_{k} e_{k-1}\right)\right) \tilde{\partial}_{k} \\
& =\left(e_{k+1} e_{k}\right)\left(h_{k} e_{k-1}\right)-\left(e_{k+1} h_{k}\right)\left(e_{k} e_{k-1}\right) \\
& \equiv a_{k, k-1}\left(e_{k+1} e_{k}\right) e_{k-1}+a_{k, k+1} e_{k+1}\left(e_{k} e_{k-1}\right) \\
& =\left(a_{k, k-1}+a_{k, k+1}\right) e_{k+1}\left(e_{k} e_{k-1}\right)+a_{k, k-1}\left(e_{k+1} e_{k}\right) e_{k-1} \\
& \equiv 0 \quad \bmod \quad\left(S_{+} \cup W, l(\bar{p})\right) .
\end{aligned}
$$

Lemma 3.3 For any element $p \in S_{+}^{c}$ and $j=1, \cdots, r$, we have

$$
(p) \tilde{\partial}_{j} \equiv 0 \quad \bmod \left(S_{+}^{c} \cup W, l(\bar{p})\right)
$$

Proof. As we have seen in Section 2, we have $S_{+}^{c}=\bigcup S_{+}^{(i)}$ with $S_{+}^{(i)} \subset S_{+}^{(i+1)}$ for $i \geq 0$. Hence our assertion is equivalent to saying that if $p \in S_{+}^{(i)}$, then $(p) \tilde{\partial}_{j} \equiv 0$ $\bmod \left(S_{+}^{(i)} \cup W, l(\bar{p})\right)$ for each $i \geq 0$. We will use induction on $i$. For $i=0$, it is simply Lemma [3.2. Suppose that $(q) \tilde{\partial}_{j} \equiv 0 \bmod \left(S_{+}^{(i)} \cup W, l(\bar{q})\right)$ for all $q \in S_{+}^{(i)}$. Let $p \in$ $S_{+}^{(i+1)} \backslash S_{+}^{(i)}$. Then $p=\langle q, r\rangle_{w}$ for some $q, r \in S_{+}^{(i)}$ and $\langle q, r\rangle_{w} \equiv(q, r)_{w} \bmod \left(S_{+}^{(i)}, w\right)$ by Lemma 2.7. Since $l(w)=l(\bar{p})$, we have

$$
\langle q, r\rangle_{w} \tilde{\partial}_{j} \equiv(q, r)_{w} \tilde{\partial}_{j} \bmod \left(S_{+}^{(i)} \cup W, l(\bar{p})\right)
$$

Thus it is enough to show that $(q, r)_{w} \tilde{\partial}_{j} \equiv 0 \bmod \left(S_{+}^{(i)} \cup W, l(\bar{p})\right)$. Write $p=(q, r)_{w}=$ $q a-b r$. Then by the induction hypothesis, we have

$$
\begin{aligned}
(q, r)_{w} \tilde{\partial}_{j}= & q(a) \tilde{\partial}_{j}+(-1)^{(\operatorname{deg} a)(\operatorname{deg} j)}(q) \tilde{\partial}_{j} a \\
& -b(r) \tilde{\partial}_{j}-(-1)^{(\operatorname{deg} r)(\operatorname{deg} j)}(b) \tilde{\partial}_{j} r \\
& \equiv 0 \quad \bmod \left(S_{+}^{(i)} \cup W, l(\bar{p})\right) .
\end{aligned}
$$

Combining Lemma 3.1 and Lemma 3.3, we obtain:
Proposition 3.4 For any element $p \in S_{+}^{c}$, we have

$$
\left\langle p, t_{i j}\right\rangle_{w} \equiv\left(p, t_{i j}\right)_{w} \equiv 0 \quad \bmod \left(S_{+}^{c} \cup W, w\right)
$$

Proposition 3.4 implies that all the compositions between the relations in $S_{+}^{c}$ and $W$ are trivial. Similarly, one can show that all the compositions between the relations in $S_{-}^{c}$ and $W$ are also trivial. Now we can present the main theorem of this section.

Theorem 3.5 Let $\mathcal{G}=\mathcal{G}(A, \tau)$ be a Kac-Moody superalgebra with the set of defining relations $S(A, \tau)=S_{+} \cup W \cup S_{-}$. Then the set $S_{+}^{c} \cup W \cup S_{-}^{c}$ is a Gröbner-Shirshov basis for the Kac-Moody superalgebra $\mathcal{G}(A, \tau)$. That is, $S(A, \tau)^{c}=S_{+}^{c} \cup W \cup S_{-}^{c}$. Hence it is also a Gröbner- Shirshov basis for the universal enveloping algebra $\mathcal{U}(\mathcal{G})$ of $\mathcal{G}(A, \tau)$.

Proof. By definition, there is no nontrivial composition among the relations in $S_{ \pm}^{c}$ and the relations in $S_{+}^{c}$ and $S_{-}^{c}$. Also, all the compositions between the relations in $S_{ \pm}^{c}$ and $W$ are trivial (see the remark after Proposition 3.4). Thus we have only to consider the compositions among the elements in $W$. We will show that $\langle p, q\rangle_{w} \equiv 0 \bmod (W, w)$ for all $p, q \in W$, where $w \in X^{*}$ is determined by $p$ and $q$. There are four cases to be considered.

If $p=h_{i} h_{j}(i>j)$ and $q=h_{j} h_{k}(j>k)$, then $w=h_{i} h_{j} h_{k}$ and

$$
\begin{aligned}
\langle p, q\rangle_{w} & =[w]_{p}-[w]_{q}=\left(h_{i} h_{j}\right) h_{k}-h_{i}\left(h_{j} h_{k}\right) \\
& =\left(h_{i} h_{j}\right) h_{k} \equiv 0 .
\end{aligned}
$$

If $p=e_{j} h_{i}+\alpha_{i j} e_{j}$ and $q=h_{i} h_{k}(i>k)$, then $w=e_{j} h_{i} h_{k}$ and

$$
\begin{aligned}
\langle p, q\rangle_{w} & =[w]_{p}-[w]_{q}=\left(e_{j} h_{i}\right) h_{k}+a_{i j} e_{j} h_{k}-e_{j}\left(h_{i} h_{k}\right) \\
& =\left(e_{j} h_{k}\right) h_{i}+a_{i j} e_{j} h_{k} \equiv-a_{k j} e_{j} h_{i}+a_{i j} e_{j} h_{k} \\
& \equiv a_{k j} a_{i j} e_{j}-a_{k j} a_{i j} e_{j}=0 .
\end{aligned}
$$

Similarly, if $p=h_{i} h_{j}(i>j)$ and $q=h_{j} f_{k}+a_{j k} f_{k}$, then $\langle p, q\rangle_{w} \equiv 0$. Finally, if $p=$ $e_{j} h_{i}+a_{i j} e_{j}$ and $q=h_{i} f_{k}+a_{i k} f_{k}$, then $w=e_{j} h_{i} f_{k}$ and

$$
\begin{aligned}
\langle p, q\rangle_{w} & =[w]_{p}-[w]_{q}=\left(e_{j} h_{i}\right) f_{k}+a_{i j} e_{j} f_{k}-e_{j}\left(h_{i} f_{k}\right)-a_{i k} e_{j} f_{k} \\
& =\left(e_{j} f_{k}\right) h_{i}+a_{i j} e_{j} f_{k}-a_{i k} e_{j} f_{k} \\
& \equiv \delta_{j k} h_{j} h_{i}+\delta_{j k} a_{i j} a_{i j} h_{j}-\delta_{j k} a_{i k} h_{j} \equiv 0,
\end{aligned}
$$

which completes the proof.

As a corollary, we obtain the triangular decomposition of Kac-Moody superalgebras and their universal enveloping algebras.

Corollary 3.6 Let $\mathcal{G}=\mathcal{G}(A, \tau)$ be a Kac-Moody superalgebra. Then we have

$$
\begin{equation*}
\mathcal{G} \cong \mathcal{G}_{+} \oplus \mathcal{G}_{0} \oplus \mathcal{G}_{-} \tag{3.5}
\end{equation*}
$$

and

$$
\begin{equation*}
U(\mathcal{G}) \cong U\left(\mathcal{G}_{+}\right) \otimes U\left(\mathcal{G}_{0}\right) \otimes U\left(\mathcal{G}_{-}\right) \tag{3.6}
\end{equation*}
$$

as $k$-linear spaces.

Proof. Observe that any super-Lyndon-Shirshov monomial of degree $\geq 2$ cannot be $W$-reduced if it contains $h_{i}$ or $e_{j} f_{k}$ as a subword. Hence by Theorem 3.5, the set $B$ of $S(A, \tau)^{c}$-reduced super-Lyndon-Shirshov monomials is given by $B=B_{+} \cup H \cup B_{-}$, where $B_{+}$(resp. $B_{-}$) is the set of $S_{+}^{c}$-reduced (resp. $S_{-}^{c}$-reduced) super-Lyndon-Shirshov monomials in $e_{i}$ 's (resp. $f_{i}$ 's). By Theorem 2.10, $B$ is a linear basis of $\mathcal{G}$, which proves the $k$-linear isomorphism (3.5). The isomorphism (3.6) follows from the Poincaré-BirkhoffWitt Theorem.

## 4 Classical Lie superalgebras

In this section, we will give an explicit construction of Gröbner-Shirshov bases for the classical Lie superalgebras. A Gröbner-Shirshov basis $S$ is said to be minimal if no proper subset of $S$ is closed under the Lie composition. We first set up some notations. Recall that we omit brackets whenever it is convenient. For the elements $x_{i} \in X$, we set $\left[x_{1} x_{2} \ldots x_{m}\right]=x_{1}\left[x_{2} \ldots x_{m}\right]$ and $\left\{x_{1} \ldots x_{m-1} x_{m}\right\}=\left\{x_{1} \ldots x_{m-1}\right\} x_{m}(m \geq 1)$. If $i>j$, we will write $x_{i j}=\left[x_{i} x_{i-1} \cdots x_{j}\right]$. For simplicity, we will also denote $x_{i i}=x_{i}$. We will use the lexicographical ordering for the set $I \times I:(i, j)>(k, l)$ if and only if $i>k$ or $i=k$, $j>l$.

We briefly recall the definition of classical Lie superalgebras [21]. Let $V=V_{\overline{0}} \oplus V_{\overline{1}}$ be a $\mathbb{Z}_{2}$-graded vector space with $\operatorname{dim} V_{\overline{0}}=m$ and $\operatorname{dim} V_{\overline{1}}=n$, and let $L$ be the space of $k$-linear endomorphisms of $V$. For each $\alpha \in \mathbb{Z}_{2}$, set

$$
L_{\alpha}=\left\{T: V \rightarrow V \mid T\left(V_{\beta}\right) \subset V_{\alpha+\beta} \text { for all } \beta \in \mathbb{Z}_{2}\right\}
$$

Then $L$ has a $\mathbb{Z}_{2}$-graded decomposition $L=L_{\overline{0}} \oplus L_{\overline{1}}$ and it becomes a Lie superalgebra with the superbracket defined by

$$
[X, Y]=X Y-(-1)^{\alpha \beta} Y X
$$

for $X \in L_{\alpha}, Y \in L_{\beta}, \alpha, \beta \in \mathbb{Z}_{2}$. The Lie superalgebra $L$ is called the general linear Lie superalgebra and is denoted by $g l(m, n)$.

Let $v_{1}, \cdots, v_{m}$ be a basis of $V_{\overline{0}}$ and $v_{m+1}, \cdots, v_{m+n}$ be a basis of $V_{\overline{1}}$. Then $L$ can be interpreted as the space of $(m+n) \times(m+n)$ matrices over $k$, and we have

$$
L_{\overline{0}}=\left\{\left.\left(\begin{array}{cc}
A & 0 \\
0 & D
\end{array}\right) \right\rvert\, A \text { is an } m \times m \text { matrix and } D \text { is an } n \times n \text { matrix }\right\}
$$

$$
L_{\overline{1}}=\left\{\left.\left(\begin{array}{cc}
0 & B \\
C & 0
\end{array}\right) \right\rvert\, B \text { is an } m \times n \text { matrix and } C \text { is an } n \times m \text { matrix }\right\} .
$$

For $X=\left(\begin{array}{ll}A & B \\ C & D\end{array}\right) \in \operatorname{gl}(m, n)$, we define the supertrace of $X$ to be $\operatorname{str} X=\operatorname{tr} A-$ $\operatorname{tr} B$, where $\operatorname{tr}$ denotes the usual trace function. Then the subspace $s l(m, n)$ of $g l(m, n)$ consisting of the matrices with supertrace 0 forms a Lie superalgebra which is called the special linear Lie superalgebra.

Let $B$ be a nondegenerate consistent supersymmetric bilinear form on $V$. Thus $V_{\overline{0}}$ and $V_{\overline{1}}$ are orthogonal to each other, $\left.B\right|_{V_{\overline{0}} \times V_{\overline{0}}}$ is symmetric, and $\left.B\right|_{V_{1} \times V_{\overline{1}}}$ is skew-symmetric (which implies $n$ must be even). For each $\alpha \in \mathbb{Z}_{2}$, define

$$
\operatorname{osp}(m, n)_{\alpha}=\left\{T \in g l(m, n)_{\alpha} \mid B(T v, w)=-(-1)^{\alpha(\operatorname{deg} v)} B(v, T w) \text { for all } v, w \in V\right\} .
$$

Then the subspace $\operatorname{osp}(m, n)=\operatorname{osp}(m, n)_{\overline{0}} \oplus \operatorname{osp}(m, n)_{\overline{1}}$ becomes a Lie superalgebra. We set

$$
\begin{align*}
B(m, n) & =\operatorname{osp}(2 m+1,2 n) \quad(m \geq 0, n>0) \\
C(n) & =\operatorname{osp}(2,2 n-2) \quad(n \geq 2)  \tag{4.1}\\
D(m, n) & =\operatorname{osp}(2 m, 2 n) \quad(m \geq 2, n>0)
\end{align*}
$$

These subalgebras are called the ortho-symplectic Lie superalgebras of type $B(m, n), C(n)$, and $D(m, n)$, respectively.

### 4.1 The special linear Lie superalgebra $\operatorname{sl}(m, n)(m, n>0)$

Let $E_{i j}$ denote the $(m+n) \times(m+n)$ matrix whose $(i, j)$-entry is equal to 1 and all the other entries are 0 , and let

$$
\begin{equation*}
x_{i}=E_{i, i+1}, \quad y_{i}=E_{i+1, i} \quad(i=1,2, \cdots, m+n-1) . \tag{4.2}
\end{equation*}
$$

Then the elements $x_{i}, y_{i}, z_{i}=\left[x_{i}, y_{i}\right](i=1,2, \cdots, m+n-1)$ generate the Lie superalgebra $s l(m, n)$.

On the other hand, let $\Omega=\{1,2, \cdots, m+n-1\}, \tau=\{m\} \subset \Omega$, and consider the generalized Cartan matrix $A=\left(a_{i j}\right)_{i, j \in \Omega}$ defined by

$$
\begin{align*}
& a_{m, m}=0, \quad a_{m, m+1}=1, \quad a_{m+1, m}=-1, \\
& a_{i j}=-1 \text { if }|i-j|=1 \text { and }(i, j) \neq(m, m+1),  \tag{4.3}\\
& a_{i j} \quad=0 \text { if }|i-j|>1 .
\end{align*}
$$

Let $\mathcal{G}=\mathcal{G}(A, \tau)$ be the Kac-Moody superalgebra associated with $(A, \tau)$ and denote by $e_{i}, f_{i}, h_{i}(i=1, \cdots, m+n-1)$ the generators of $\mathcal{G}$. Then it is straightforward to verify that the generators $x_{i}, y_{i}, z_{i}(i=1, \cdots, m+n-1)$ of the Lie superalgebra $s l(m, n)$ also satisfy the defining relations of the Kac-Moody algebra $\mathcal{G}=\mathcal{G}(A, \tau)$. Hence there exists a surjective Lie superalgebra homomorphism $\phi: \mathcal{G} \rightarrow s l(m, n)$ given by $e_{i} \mapsto x_{i}, f_{i} \mapsto y_{i}$, $h_{i} \mapsto z_{i}(i=1,2, \cdots, m+n-1)$.

In the following lemma, we will derive more "refined" relations of $\mathcal{G}$, which will be used to construct a Gröbner-Shirshov basis for the special linear Lie superalgebra $\operatorname{sl}(m, n)$. Recall that we use the notation $e_{i j}=\left[e_{i} e_{i-1} \cdots e_{j}\right]$ for $i>j$ and $e_{i i}=e_{i}$.

Lemma 4.1 In the Kac-Moody superlagebra $\mathcal{G}=\mathcal{G}(A, \tau)$, we have

$$
\begin{equation*}
e_{i j} e_{k l}=\delta_{j-1, k} e_{i l} \quad \text { for all }(i, j) \geq(k, l) \tag{4.4}
\end{equation*}
$$

Proof. We will proceed in several steps.
Step 1: For all $j>k+1$, we have $e_{i j} e_{k l}=0$.
By the Serre relations, we have $e_{j} e_{l}=0$ for all $j>l+1$. Next, fix $l$ and assume that $j>k+1, k>l$. Then by the Jacobi identity and induction hypothesis, we get

$$
e_{j} e_{k l}=e_{j}\left(e_{k} e_{k-1, l}\right)=\left(e_{j} e_{k}\right) e_{k-1, l}+(-1)^{d} e_{k}\left(e_{j} e_{k-1, l}\right)=0
$$

where $d=\left(\operatorname{deg} e_{j}\right)\left(\operatorname{deg} e_{k}\right) \in \mathbb{Z}_{2}$. Finally, fix $j$ and assume that $i>j>k+1$. Then the induction argument yields

$$
e_{i j} e_{k l}=\left(e_{i} e_{i-1, j}\right) e_{k l}=e_{i}\left(e_{i-1, j} e_{k l}\right)+(-1)^{d}\left(e_{i} e_{k l}\right) e_{i-1, j}=0
$$

where $d=\left(\operatorname{deg} e_{i}\right)\left(\operatorname{deg} e_{i-1}\right) \in \mathbb{Z}_{2}$.
Step 2: For all $i, j, k \in \Omega$, we have $e_{i j} e_{j-1, k}=e_{i k}$.
If $i=j$, there is nothing to prove. If $i>j$, then by induction argument and Step 1 , we obtain

$$
\begin{aligned}
e_{i j} e_{j-1, k} & =\left(e_{i} e_{i-1, j}\right) e_{j-1, k}=e_{i}\left(e_{i-1, j} e_{j-1, k}\right)+(-1)^{d}\left(e_{i} e_{j-1, k}\right) e_{i-1, j} \\
& =e_{i i} e_{i-1, k}=e_{i k},
\end{aligned}
$$

where $d=\left(\operatorname{deg} e_{i}\right)\left(\operatorname{deg} e_{i-1}\right) \in \mathbb{Z}_{2}$.
Step 3: For all $i>j$, we have $e_{i} e_{i j}=0$ and $e_{i j} e_{j}=0$.

By the Serre relations, we have $e_{i} e_{i, i-1}=0$. If $i \geq j+2$, then Step 2 implies $e_{i j}=$ $e_{i, i-1} e_{i-2, j}$. Hence by Step 1, we obtain

$$
e_{i} e_{i j}=e_{i}\left(e_{i, i-1} e_{i-2, j}\right)=\left(e_{i} e_{i, i-1}\right) e_{i-2, j}+(-1)^{d} e_{i, i-1}\left(e_{i} e_{i-2, j}\right)=0,
$$

where $d=\left(\operatorname{deg} e_{i}\right)\left(\operatorname{deg} e_{i, i-1}\right) \in \mathbb{Z}_{2}$.
Similarly, we get $e_{i j} e_{j}=0$ for $i>j$.
Step 4: For all $k, l \geq 1$, we have $h_{i} e_{i+k, i-l}=0$.
By the relations in $W$, we obtain

$$
h_{i} e_{i+k, i-l}=\left(a_{i, i+1}+a_{i i}+a_{i, i-1}\right) e_{i+k, i-l}=0
$$

Step 5: For all $i>j$, we have $e_{i j} e_{i-1}=0$.
If $j=i-1$, then by the Serre relations, we get $e_{i j} e_{i-1}=0$. Suppose first that $j<i-1$ and $i-1 \neq m$. The by Step 3, we obtain

$$
\begin{aligned}
\left(e_{i j} e_{i-1}\right) e_{i-1} & =\left(\left(e_{i} e_{i-1, j}\right) e_{i-1}\right) e_{i-1} \\
& =\left(e_{i}\left(e_{i-1, j} e_{i-1}\right)+(-1)^{d}\left(e_{i} e_{i-1}\right) e_{i-1, j}\right) e_{i-1} \\
& =(-1)^{d}\left(e_{i} e_{i-1}\right)\left(e_{i-1, j} e_{i-1}\right)+(-1)^{d^{\prime}}\left(\left(e_{i} e_{i-1}\right) e_{i-1}\right) e_{i-1, j} \\
& =0,
\end{aligned}
$$

where $d=\left(\operatorname{deg} e_{i}\right)\left(\operatorname{deg} e_{i-1}\right)$ and $d^{\prime}=\left(\operatorname{deg} e_{i-1}\right)\left(\operatorname{deg} e_{i-1, j}\right)$. Multiplying both sides by $f_{i-1}$ yields

$$
\begin{aligned}
0 & =\left(\left(e_{i j} e_{i-1}\right) e_{i-1}\right) f_{i-1} \\
& =\left(e_{i j} e_{i-1}\right)\left(e_{i-1} f_{i-1}\right)+\left(\left(e_{i j} e_{i-1}\right) f_{i-1}\right) e_{i-1} \\
& =\left(e_{i j} e_{i-1}\right) h_{i-1}+\left(e_{i j} h_{i-1}\right) e_{i-1}+\left(\left(e_{i j} f_{i-1}\right) e_{i-1}\right) e_{i-1}
\end{aligned}
$$

The second summand is equal to 0 by Step 4 . Since $e_{i j} f_{i-1}$ is a scalar multiple of $e_{i} e_{i-2, j}$, the third summand is also equal to 0 . By the Jacobi identity and Step 4 , the first summand yields $2 e_{i j} e_{i-1}=0$, which proves our claim.

If $j<i-1$ and $i-1=m$, since $\left(e_{m+1} e_{m}\right)\left(e_{m} e_{m-1}\right)=0$ by the Serre relations, we get

$$
\begin{aligned}
e_{m+1, j} e_{m} & =e_{m+1}\left(e_{m j} e_{m}\right)-\left(e_{m+1} e_{m}\right) e_{m j} \\
& =-\left(e_{m+1} e_{m}\right)\left(e_{m}\left(e_{m-1} e_{m-2, j}\right)\right) \\
& =-\left(e_{m+1} e_{m}\right)\left(\left(e_{m} e_{m-1}\right) e_{m-2, j}\right) \\
& =-\left(\left(e_{m+1} e_{m}\right)\left(e_{m} e_{m-1}\right)\right) e_{m-2, j}+\left(e_{m} e_{m-1}\right)\left(\left(e_{m+1} e_{m}\right) e_{m-2, j}\right)=0
\end{aligned}
$$

Step 6: For all $n>k \geq 0, m>l \geq 0$, we have $e_{m+k, m-l} e_{m+k, m-l}=0$.
Suppose $k=0$. If $l=0$, then we have to show that $e_{m} e_{m}=0$. Note that

$$
0=e_{m}\left(e_{m} e_{m-1}\right)=\left(e_{m} e_{m}\right) e_{m-1}-e_{m}\left(e_{m} e_{m-1}\right)=\left(e_{m} e_{m}\right) e_{m-1}
$$

Multiplying both sides by $f_{m-1}$, we obtain

$$
\begin{aligned}
0 & =\left(\left(e_{m} e_{m}\right) e_{m-1}\right) f_{m-1} \\
& =\left(e_{m} e_{m}\right)\left(e_{m-1} f_{m-1}\right)+\left(\left(e_{m} e_{m}\right) f_{m-1}\right) e_{m-1} \\
& =\left(e_{m} e_{m}\right) h_{m-1}=2 e_{m} e_{m},
\end{aligned}
$$

which implies $e_{m} e_{m}=0$.
Next, suppose $l>0$. If $e_{m, m-l} e_{m, m-l}=0$, then

$$
\begin{aligned}
0 & =\left(\left(e_{m, m-l} e_{m, m-l}\right) e_{m-l-1}\right) e_{m-l-1} \\
& =\left(e_{m, m-l} e_{m, m-l-1}\right) e_{m-l-1}+\left(e_{m, m-l-1} e_{m, m-l}\right) e_{m-l-1} \\
& =2 e_{m, m-l-1} e_{m, m-l-1},
\end{aligned}
$$

which yields $e_{m, m-l-1} e_{m, m-l-1}=0$. Hence, by the downward induction, we conclude $e_{m, m-l} e_{m, m-l}=0$ for all $m>l \geq 0$.

Finally, if $k>0$, then our assertion follows from the same downward induction argument as above.

Step 7: For all $k \geq k^{\prime}, l \leq l^{\prime}$, we have $e_{m+k, m-l} e_{m+k^{\prime}, m-l^{\prime}}=0$.
Suppose $k^{\prime}=k$. If $l=l^{\prime}$, then our assertion was proved in Step 6. If $l<l^{\prime}$ and $e_{m+k, m-l} e_{m+k, m-l^{\prime}}=0$, then

$$
\begin{aligned}
0 & =\left(e_{m+k, m-l} e_{m+k, m-l^{\prime}}\right) e_{m-l^{\prime}-1} \\
& =e_{m+k, m-l}\left(e_{m+k, m-l^{\prime}-1}\right)+\left(e_{m+k, m-l} e_{m-l^{\prime}-1}\right) e_{m+k, m-l^{\prime}} \\
& =e_{m+k, m-l} e_{m+k, m-l^{\prime}-1} .
\end{aligned}
$$

Hence by the downward induction, we get $e_{m+k, m-l} e_{m+k, m-l^{\prime}}=0$ for all $l \leq l^{\prime}$.
If $k>k^{\prime}$, our assertion follows by the same downward induction argument.
Step 8: For all $i \geq j>1$, we have $e_{i j} e_{i, j-1}=0$.
If $i=j$, then our assertion is just the Serre relation. Suppose $i>j$ and $i+1 \neq m$. Then if $e_{i j} e_{i, j-1}=0$, we have

$$
\begin{aligned}
0 & =e_{i+1}\left(e_{i+1}\left(e_{i j} e_{i, j-1}\right)\right) \\
& =e_{i+1}\left(e_{i+1, j} e_{i, j-1}\right)+(-1)^{d} e_{i+1}\left(e_{i j} e_{i+1, j-1}\right) \\
& =(-1)^{d^{\prime}} e_{i+1, j} e_{i+1, j-1}+(-1)^{d} e_{i+1, j} e_{i+1, j-1},
\end{aligned}
$$

where $d=\left(\operatorname{deg} e_{i+1}\right)\left(\operatorname{deg} e_{i j}\right)$ and $d^{\prime}=\left(\operatorname{deg} e_{i+1}\right)\left(\operatorname{deg} e_{i+1, j}\right)$. Since $i+1 \neq m$, we have $e_{i+1, j} e_{i+1, j-1}=0$ and the induction argument gives our relations. If $i>j, i+1=m$ and $e_{i j} e_{i, j-1}=0$, then by Step 7, we get $e_{i+1, j} e_{i+1, j-1}=e_{m j} e_{m, j-1}=0$. Hence our assertion follows from the induction.

Step 9: For all $k \neq j-1,(i, j) \geq(k, l)$, we have $e_{i j} e_{k l}=0$.
Fix $k=i$. If $l=j$, then our assertion holds by Step 6. If $l=j-1$, then it is just Step 8. If $l<j-1$, then, by Step 1 and Step 8, we have

$$
\begin{aligned}
e_{i j} e_{i l} & =e_{i j}\left(e_{i, j-1} e_{j-2, l}\right) \\
& =\left(e_{i j} e_{i, j-1}\right) e_{j-2, l}+(-1)^{d} e_{i, j-1}\left(e_{i j} e_{j-2, l}\right)=0,
\end{aligned}
$$

where $d=\left(\operatorname{deg} e_{i j}\right)\left(\operatorname{deg} e_{i, j-1}\right) \in \mathbb{Z}_{2}$.
Suppose $k<i$. If $j>k+1$, our assertion holds by Step 1 . Let us assume $k \geq j$. If $k=l$, then we may assume $k<i-1$ by Step 5 , and we have

$$
\begin{aligned}
e_{i j} e_{k} & =\left(e_{i, k+2} e_{k+1, j}\right) e_{k} \\
& =e_{i, k+2}\left(e_{k+1, j} e_{k}\right)+(-1)^{d}\left(e_{i, k+2} e_{k}\right) e_{k+1, j}=0
\end{aligned}
$$

We shall use induction on $k-l$. Note that if $k>l$, then we have

$$
e_{i j} e_{k l}=e_{i j}\left(e_{k} e_{k-1, l}\right)=\left(e_{i j} e_{k}\right) e_{k-1, l}+(-1)^{d} e_{k}\left(e_{i j} e_{k-1, l}\right),
$$

where $d=\left(\operatorname{deg} e_{i j}\right)\left(\operatorname{deg} e_{k}\right) \in \mathbb{Z}_{2}$. The first summand is equal to 0 by the case $k=l$. Consider the second summand. If $j \neq k$, then it is 0 by the induction hypothesis. If $j=k$, then by Step 2 , it is equal to

$$
(-1)^{d} e_{k}\left(e_{i k} e_{k-1, l}\right)=(-1)^{d} e_{k} e_{i l}=0
$$

Let $X=E \cup H \cup F=\left\{e_{i}, h_{i}, f_{i} \mid i \in \Omega\right\}$ be a $\mathbb{Z}_{2}$-graded set, where $\Omega=\{1,2, \cdots, m+$ $n-1\}$ and $\tau=\{m\}$ is the set of odd index. Let $R_{+}$be the set of relations in $E^{\#}$ given by:
I. $e_{i} e_{j}(i>j+1)$,
II. $e_{i j} e_{i-1}(i>j)$,
III. $e_{i j} e_{i, j-1} \quad(i \geq j>1)$,
IV. $e_{m+k, m-l} e_{m+k, m-l} \quad(n>k \geq 0, m>l \geq 0)$.

Let $R_{-}$be the set of relations in $F^{\#}$ obtained by replacing $e_{i j}$ 's in $R_{+}$by $f_{i j}$ ', and let $R(A, \tau)=R_{+} \cup W \cup R_{-}$. Consider the Lie superalgebra $L=\mathcal{L}_{X} /\langle R(A, \tau)\rangle$, where $\langle R(A, \tau)\rangle$ denotes the ideal in $\mathcal{L}_{X}$ generated by $R(A, \tau)$. Then, by Lemma 4.1, there is a surjective Lie superalgebra homomorphism $\psi: L \rightarrow \mathcal{G}$ defined by $e_{i} \mapsto e_{i}, h_{i} \mapsto h_{i}$, $f_{i} \mapsto f_{i}(i \in \Omega)$. We now prove the main result of this subsection.

Theorem 4.2 The set $R(A, \tau)$ of relations in $\mathcal{L}_{X}$ is a Gröbner-Shirshov basis for the Lie superalgebra $L$.

Proof. Set $R=R(A, \tau)$. As in the proof of Corollary 3.6, the set of $R(A, \tau)$-reduced super-Lyndon-Shirshov monomials is $B=B_{+} \cup H \cup B_{-}$, where $B_{ \pm}$is the set of $R_{ \pm-}$ reduced super-Lyndon-Shirshov monomials in $\mathcal{L}_{E}$ (resp. in $\mathcal{L}_{F}$ ). We claim that the set of $R_{+}$-reduced Lyndon-Shirshov monomials in $\mathcal{L}_{E}$ is

$$
B_{+}^{\prime}=\left\{e_{i j} \mid m+n>i \geq j \geq 1\right\} .
$$

Let $w$ be an $R_{+}$-reduced Lyndon-Shirshov monomial in $\mathcal{L}_{E}$. If $l(w)=1$, then there is nothing to prove. Suppose that $l(w)>1$. Then $w=u v$, where $u$, $v$ are $R_{+}$-reduced Lyndon-Shirshov monomials. By induction, we have $w=e_{i j} e_{k l}$, where $i \geq j, k \geq l$ and $(i, j)>(k, l)$ in the lexicographical ordering. Note that we must have $i>k$, for if $i=k$, then $j-1 \geq l$ and $\overline{e_{i j} e_{i, j-1}}$ is a subword of $\bar{w}$. We will show that $k=j-1$ and $i=j$. If $k>j$, then $\bar{w}$ contains $\overline{e_{k+1, j} e_{k}}$ as a subword, and if $k=j$, then $\bar{w}$ contains $\overline{\left(e_{k+1} e_{k}\right) e_{k}}$ as a subword. Finally, if $k \leq j-2$, then $\bar{w}$ contains $\overline{e_{j} e_{k}}$ as a subword. Hence we must have $k=j-1$. Moreover, since $w$ is a Lyndon-Shirshov monomial, we must have $i=j$. Therefore, we obtain $w=e_{i l}$, which proves our claim.

Now, let $w$ be an $R_{+}$-reduced super-Lyndon-Shirshov monomial in $\mathcal{L}_{E}$. Then $w$ is a Lyndon-Shirshov monomial or $w=u u$ with $u$ a Lyndon-Shirshov monomial in $E_{\overline{1}}^{\#}$. If the latter is true, then, as we have seen in the previous paragraph, we have $u=e_{m+k, m-l}$ ( $n>k \geq 0, m>l \geq 0$ ), in which case $w$ is not $R_{+}$-reduced by IV. Therefore we have

$$
B_{+}=B_{+}^{\prime}=\left\{e_{i j} \mid m+n>i \geq j \geq 1\right\}
$$

Similarly, we get $B_{-}=\left\{f_{i j} \mid m+n>i \geq j \geq 1\right\}$.
By Lemma 2.4, $B$ spans $L$. Since $\phi$ and $\psi$ are surjective, we have $\operatorname{card}(B) \geq$ $\operatorname{dim} s l(m, n)$. But the number of elements of $B$ is $(m+n)^{2}-1$, which is equal to the dimension of $\operatorname{sl}(m, n)$. Thus $\phi$ and $\psi$ are isomorphisms and $B$ is a linear basis of $L$. Therefore, by Proposition 2.9, $R$ is a Gröbner-Shirshov basis for $L$.

Remark. The proof of Theorem 4.2 shows that the Lie superalgebras $L, \mathcal{G}(A, \tau)$ and $s l(m, n)$ are all isomorphic. Hence Theorem 4.2 gives a Gröbner-Shirshov basis for the Lie superalgebra $s l(m, n)$. Our argument also shows that $R(A, \tau)$ is actually a minimal Gröbner-Shirshov basis.

### 4.2 The Lie superalgebras of type $B(m, n) \quad(m, n>0)$

Let $E_{i j}$ denotes the $(2 m+2 n+1) \times(2 m+2 n+1)$ matrix whose $(i, j)$-entry is 1 and all the other entries are 0 . Set

$$
\begin{align*}
& x_{i}=E_{2 m+i+1,2 m+i+2}-E_{2 m+n+i+2,2 m+n+i+1} \quad(1 \leq i \leq n-1), \\
& x_{n}=E_{2 m+n+1,1}+E_{m+1,2 m+2 n+1}, \\
& x_{n+i}=E_{i, i+1}-E_{m+i+1, m+i} \quad(1 \leq i \leq m-1), \\
& x_{m+n}=\sqrt{2}\left(E_{m, 2 m+1}-E_{2 m+1,2 m}\right),  \tag{4.5}\\
& y_{i}=E_{2 m+i+2,2 m+i+1}-E_{2 m+n+i+1,2 m+n+i+2} \quad(1 \leq i \leq n-1), \\
& y_{n}=E_{1,2 m+n+1}-E_{2 m+2 n+1, m+1}, \\
& y_{n+i}=E_{i+1, i}-E_{m+i, m+i+1} \quad(1 \leq i \leq m-1), \\
& y_{m+n}=\sqrt{2}\left(E_{2 m+1, m}-E_{2 m, 2 m+1}\right) .
\end{align*}
$$

Then the elements $x_{i}, y_{i}, z_{i}=\left[x_{i}, y_{i}\right](i=1,2, \cdots, m+n)$ generate the ortho-symplectic Lie superalgebra $B(m, n)=\operatorname{osp}(2 m+1,2 n)(m, n>0)$ and $x_{n}, y_{n}$ are the odd generators.

On the other hand, let $\Omega=\{1,2, \ldots m+n\}, \tau=\{n\} \subset \Omega$, and consider the generalized Cartan matrix $A=\left(a_{i j}\right)_{i, j \in \Omega}$ defined by

$$
\begin{align*}
& a_{n, n}=0, \quad a_{n, n+1}=1, \quad a_{m+n, m+n-1}=-2, \\
& a_{i j}=-1 \quad \text { if }|i-j|=1, \quad(i, j) \neq(n, n+1),(m+n, m+n-1),  \tag{4.6}\\
& a_{i j}=0 \quad \text { if }|i-j|>1 .
\end{align*}
$$

Let $\mathcal{G}=\mathcal{G}(A, \tau)$ be the Kac-Moody superalgebra associated with $(A, \tau)$ and denote by $e_{i}, f_{i}, h_{i}(i=1,2, \cdots, m+n)$ the generators of $\mathcal{G}$. Then, as in the case of $\operatorname{sl}(m, n)$, one can verify that the generators $x_{i}, y_{i}, z_{i}(i=1,2, \cdots, m+n)$ of the Lie superalgebra $\operatorname{osp}(2 m+1,2 n)$ satisfy the defining relations of the Kac-Moody superalgebra $\mathcal{G}(A, \tau)$. Hence there exists a surjective Lie superalgebra homomorphism $\phi: \mathcal{G} \rightarrow \operatorname{osp}(2 m+1,2 n)$ given by $e_{i} \mapsto x_{i}, f_{i} \mapsto y_{i}, h_{i} \mapsto z_{i}(i=1,2, \cdots, m+n)$. As in Section 4.1, we first derive more relations in $\mathcal{G}$, which will be used to construct a Gröbner-Shirshov basis for the ortho-symplectic Lie superalgebra $B(m, n)=\operatorname{osp}(2 m+1,2 n)(m, n>0)$.

Lemma 4.3 In the Kac-Moody superalgebra $\mathcal{G}=\mathcal{G}(A, \tau)$, we have

$$
\begin{align*}
& e_{i j} e_{k l}=\delta_{j-1, k} e_{i l} \quad \text { if }(i, j) \geq(k, l), m+n>k, \\
& {\left[e_{m+n, i} e_{m+n, j} e_{m+n, k}\right]=0 \quad(i, j, k \in \Omega)}  \tag{4.7}\\
& \left(e_{m+n, i} e_{m+n, j}\right)\left(e_{m+n, k} e_{m+n, l}\right)=0 \quad(i, j, k, l \in \Omega)
\end{align*}
$$

Proof. As in Lemma 4.1, we will prove our assertion in several steps.
Step 1: For all $(i, j)>(k, l)$ and $m+n>k$, we have $e_{i j} e_{k l}=\delta_{j-1, k} e_{i l}$.
If we remove the $(m+n)$-th row and the $(m+n)$-th column of $A$, then we get the generalized Cartan matrix for the Lie superalgebra $\operatorname{sl}(m, n)$. Thus we have only to consider the case when $i=m+n$. Suppose $k \leq m+n-2$. If $j=m+n$, then $e_{m+n} e_{k l}=0$ as in Step 1 of the proof of Lemma 4.1. If $j<m+n$, then we have

$$
\begin{aligned}
e_{m+n, j} e_{k l} & =\left(e_{m+n} e_{m+n-1, j}\right) e_{k l} \\
& =e_{m+n}\left(e_{m+n-1, j} e_{k l}\right)+(-1)^{d}\left(e_{m+n} e_{k l}\right) e_{m+n-1, j} \\
& =\delta_{j-1, k} e_{m+n} e_{m+n-1, l}=\delta_{j-1, k} e_{m+n, l}
\end{aligned}
$$

where $d=\left(\operatorname{deg} e_{m+n}\right)\left(\operatorname{deg} e_{m+n-1, j}\right)$.
If $k=m+n-1$ and $j=m+n$, then $e_{m+n} e_{m+n-1, l}=e_{m+n, l}$ and if $j<m+n-1$, then

$$
\begin{aligned}
e_{m+n, j} e_{m+n-1, l} & =e_{m+n, j}\left(e_{m+n-1} e_{m+n-2, l}\right) \\
& =\left(e_{m+n, j} e_{m+n-1}\right) e_{m+n-2, l}+(-1)^{d} e_{m+n-1}\left(e_{m+n, j} e_{m+n-2, l}\right) \\
& =\left(e_{m+n, j} e_{m+n-1}\right) e_{m+n-2, l}+(-1)^{d} \delta_{j-1, m+n-2} e_{m+n-1} e_{m+n, l}
\end{aligned}
$$

where $d=\left(\operatorname{deg} e_{m+n, j}\right)\left(\operatorname{deg} e_{m+n-1}\right)$. As in Step 5 of the proof of Lemma 4.1, we have $e_{m+n, j} e_{m+n-1}=0$, which proves our claim.

Step 2: For all $i \in \Omega$, we have $\left[e_{m+n} e_{m+n} e_{m+n, i}\right]=0$.
It is clear that $\left[e_{m+n} e_{m+n} e_{m+n}\right]=0$. Suppose that $\left[e_{m+n} e_{m+n} e_{m+n, i}\right]=0$ for $i<m+n$. Multiplying both sides by $e_{i-1}$, we obtain

$$
\begin{aligned}
0 & =\left[e_{m+n} e_{m+n} e_{m+n, i}\right] e_{i-1} \\
& =e_{m+n}\left(\left(e_{m+n} e_{m+n, i}\right) e_{i-1}\right)+(-1)^{d}\left(e_{m+n} e_{i-1}\right)\left(e_{m+n} e_{m+n, i}\right) \\
& =e_{m+n}\left(e_{m+n} e_{m+n, i-1}\right)+(-1)^{d^{\prime}} e_{m+n}\left(\left(e_{m+n} e_{i-1}\right) e_{m+n, i}\right) \\
& =\left[e_{m+n} e_{m+n} e_{m+n, i-1}\right]
\end{aligned}
$$

for $d, d^{\prime} \in \mathbb{Z}_{2}$, and the downward induction on $i$ gives our claim.

Step 3: $\left[e_{m+n} e_{m+n} e_{m+n-1}\right]\left(e_{m+n} e_{m+n-1}\right)=0$.
If $m \neq 1$, then by the Serre relation, we get

$$
\begin{aligned}
& {\left[e_{m+n} e_{m+n} e_{m+n-1}\right]\left(e_{m+n} e_{m+n-1}\right)} \\
& =\left(\left[e_{m+n} e_{m+n} e_{m+n-1}\right] e_{m+n}\right) e_{m+n-1}+e_{m+n}\left(\left[e_{m+n} e_{m+n} e_{m+n-1}\right] e_{m+n-1}\right) \\
& =-\left[e_{m+n} e_{m+n} e_{m+n} e_{m+n-1}\right] e_{m+n-1}+e_{m+n}\left(e_{m+n}\left\{e_{m+n} e_{m+n-1} e_{m+n-1}\right\}\right)=0
\end{aligned}
$$

If $m=1$, then

$$
\begin{aligned}
& {\left[e_{n+1} e_{n+1} e_{n}\right]\left(e_{n+1} e_{n}\right)=\left(\left[e_{n+1} e_{n+1} e_{n}\right] e_{n+1}\right) e_{n}+e_{n+1}\left(\left[e_{n+1} e_{n+1} e_{n}\right] e_{n}\right)} \\
& =e_{n+1}\left(e_{n+1}\left\{e_{n+1} e_{n} e_{n}\right\}\right)-e_{n+1}\left(\left(e_{n+1} e_{n}\right)\left(e_{n+1} e_{n}\right)\right) \\
& =-\left[e_{n+1} e_{n+1} e_{n}\right]\left(e_{n+1} e_{n}\right)-\left(e_{n+1} e_{n}\right)\left[e_{n+1} e_{n+1} e_{n}\right] \\
& =-2\left[e_{n+1} e_{n+1} e_{n}\right]\left(e_{n+1} e_{n}\right)
\end{aligned}
$$

which yields $\left[e_{n+1} e_{n+1} e_{n}\right]\left[e_{n+1} e_{n}\right]=0$.
Step 4: For all $i \in \Omega$, we have

$$
\left[e_{m+n} e_{m+n} e_{m+n-1}\right] e_{m+n, i}=0, \quad\left(e_{m+n} e_{m+n, i}\right)\left(e_{m+n} e_{m+n-1}\right)=0
$$

Let $a=\left[e_{m+n} e_{m+n} e_{m+n-1}\right] e_{m+n, i}$ and $b=\left(e_{m+n} e_{m+n, i}\right)\left(e_{m+n} e_{m+n-1}\right)$. If $m \neq 1$, then by Step 2 and Step 3, we obtain

$$
\begin{aligned}
0 & =\left[e_{m+n} e_{m+n} e_{m+n, i}\right] e_{m+n-1} \\
& =e_{m+n}\left\{e_{m+n} e_{m+n, i} e_{m+n-1}\right\}+\left(e_{m+n} e_{m+n-1}\right)\left(e_{m+n} e_{m+n, i}\right) \\
& =e_{m+n}\left\{e_{m+n} e_{m+n-1} e_{m+m, i}\right\}-b=a-2 b,
\end{aligned}
$$

and

$$
\begin{aligned}
0= & \left(\left[e_{m+n} e_{m+n} e_{m+n-1}\right]\left(e_{m+n} e_{m+n-1}\right)\right) e_{m+n-2, i} \\
& =\left[e_{m+n} e_{m+n} e_{m+n-1}\right] e_{m+n, i}+\left(\left[e_{m+n} e_{m+n} e_{m+n-1}\right] e_{m+n-2, i}\right)\left(e_{m+n} e_{m+n-1}\right) \\
& =a+e_{m+n}\left\{e_{m+n} e_{m+n-1} e_{m+n-2, i}\right\}\left(e_{m+n} e_{m+n-1}\right)=a+b .
\end{aligned}
$$

Hence we have $a=b=0$. Similarly, if $m=1$, then we get $a+b=0$ and $a+2 b=0$, which implies $a=b=0$.

Step 5: For all $i, j \in \Omega$, we have $\left\{e_{m+n} e_{m+n, i} e_{m+n, j}\right\}=0$.
If $j=m+n$ or $j=m+n-1$, our assertion holds by Step 2 and Step 4. We will use the downward induction on $j$. Suppose $j<m+n-1$ and $\left\{e_{m+n} e_{m+n, i} e_{m+n, j}\right\}=0$ for all
$i \in \Omega$. Then we have

$$
\begin{aligned}
0 & =\left\{e_{m+n} e_{m+n, i} e_{m+n, j}\right\} e_{j-1} \\
& =\left(e_{m+n} e_{m+n, i}\right) e_{m+n, j}+\left(\left(e_{m+n} e_{m+n, i}\right) e_{j-1}\right) e_{m+n, j} \\
& =\left\{e_{m+n} e_{m+n, i} e_{m+n, j-1}\right\}+\delta_{i j}\left(e_{m+n} e_{m+n, i-1}\right) e_{m+n, j} \\
& =\left\{e_{m+n} e_{m+n, i} e_{m+n, j-1}\right\},
\end{aligned}
$$

which proves our claim.
Step 6: For all $i, j, k \in \Omega$, we have $\left[e_{m+n, i} e_{m+n, j} e_{m+n, k}\right]=0$.
If $i=m+n$, Step 5 implies

$$
e_{m+n}\left(e_{m+n, j} e_{m+n, k}\right)=\left(e_{m+n} e_{m+n, j}\right) e_{m+n, k}+e_{m+n, j}\left(e_{m+n} e_{m+n, k}\right)=0 .
$$

If $i<m+n$, by the above observation, we get

$$
\begin{aligned}
& {\left[e_{m+n, i} e_{m+n, j} e_{m+n, k}\right]=\left(e_{m+n} e_{m+n-1, i}\right)\left(e_{m+n, j} e_{m+n, k}\right)} \\
& =e_{m+n}\left[e_{m+n-1, i} e_{m+n, j} e_{m+n, k}\right]+(-1)^{d}\left[e_{m+n} e_{m+n, j} e_{m+n, k}\right] e_{m+n-1, i} \\
& =(-1)^{d^{\prime}} \delta_{m+n, j}\left[e_{m+n} e_{m+n, i} e_{m+n, k}\right]+(-1)^{d^{\prime \prime}} \delta_{m+n, k}\left[e_{m+n} e_{m+n, j} e_{m+n, i}\right]=0,
\end{aligned}
$$

where $d, d^{\prime}, d^{\prime \prime} \in \mathbb{Z}_{2}$.
It remains to prove the last relation. But it is an immediate consequence of Step 6.

Let $X=E \cup H \cup F=\left\{e_{i}, h_{i}, f_{i} \mid i \in \Omega\right\}$ be a $\mathbb{Z}_{2}$-graded set, where $\Omega=\{1,2, \cdots, m+n\}$ and $\tau=\{n\}$ is the set of odd index. Let $R_{+}$be the set of relations in $E^{\#}$ given by:
I. $e_{i} e_{j} \quad(m+n \geq i>j+1>1)$,
II. $e_{i j} e_{i-1} \quad(m+n \geq i>j \geq 1)$,
III. $e_{i j} e_{i, j-1} \quad(m+n>i \geq j>1)$,
IV. $e_{n+k, n-l} e_{n+k, n-l} \quad(m>k \geq 0, n>l \geq 0)$,
V. $\left[e_{m+n, i} e_{m+n, j} e_{m+n, j-1}\right] \quad(m+n \geq i \geq j>1)$,
VI. $\left\{e_{m+n, i} e_{m+n, j} e_{m+n, i-1}\right\} \quad(m+n \geq i>j \geq 1)$,
VII. $\left(e_{m+n, i} e_{m+n, j}\right)\left(e_{m+n, i} e_{m+n, j}\right) \quad(m+n \geq i>n \geq j \geq 1)$,
VIII. $\left(e_{m+n, i} e_{m+n, j}\right)\left(e_{m+n, i} e_{m+n, j-1}\right) \quad(n \geq i>j>1)$.

Let $R_{-}$be the set of relations in $F^{\#}$ obtained by replacing $e_{i j}$ 's in $R_{+}$by $f_{i j}$ 's, and let $R(A, \tau)=R_{+} \cup W \cup R_{-}$. Consider the Lie superalgebra $L=\mathcal{L}_{X} /\langle R(A, \tau)\rangle$. Then, by Lemma 4.3, there exists a surjective Lie superalgebra homomorphism $\psi: L \rightarrow \mathcal{G}$ defined by $e_{i} \mapsto e_{i}, h_{i} \mapsto h_{i}$ and $f_{i} \mapsto f_{i}(i \in \Omega)$. Then we have :

Theorem 4.4 The set $R(A, \tau)$ of the relations in $\mathcal{L}_{X}$ is a Gröbner-Shirshov basis for the Lie superalgebra $L$.

Proof. Set $R=R(A, \tau)$. As in the case of $\operatorname{sl}(m, n)$, the set of $R(A, \tau)$-reduced super-Lyndon-Shirshov monomials is $B=B_{+} \cup H \cup B_{-}$. We claim that the set of $R_{+}$-reduced Lyndon-Shirshov monomials in $\mathcal{L}_{E}$ is

$$
B_{+}^{\prime}=\left\{e_{i j} \mid i \geq j\right\} \cup\left\{e_{m+n, i} e_{m+n, j} \mid i>j\right\} .
$$

Let $w$ be an $R_{+}$-reduced Lyndon-Shirshov monomial in $\mathcal{L}_{E}$. If $l(w)=1$, there is nothing to prove. If $l(w)>1$, then $w=u v$, where $u, v$ are $R_{+}$-reduced Lyndon-Shirshov monomials. Hence by induction, we have $u, v \in B_{+}^{\prime}$. We will show that either $u=e_{m+n, j}$, $v=e_{m+n, l}$ with $j>l$ or $u=e_{i}, v=e_{i-1, l}$, which would prove our claim. We need to consider the following four cases.

Case 1. $u=e_{i j}, v=e_{k l} \quad(i \geq j, k \geq l):$
Since $u v$ is Lyndon-Shirshov, we have $(i, j)>(k, l)$ lexicographically. If $i=k=m+n$, then $u=e_{m+n, j}, v=e_{m+n, l}$ with $j>l$. If $i=k<m+n$, then $j-1 \geq l$, and $\overline{e_{i j} e_{k l}}$ contains $\overline{e_{i j} e_{i, j-1}}$ as a subword. Hence $w$ is not $R_{+}$-reduced by III. If $i=j>k$ and $k=i-1$, then $u$ and $v$ have the desired form and we are done. If $i=j>k$ and $k \leq i-2$, then $w$ is not $R_{+}$-reduced by I. If $i>k$ and $i>j$, then we must have $k=i-1$, since $e_{i j}=e_{i} e_{i-1, j}$ and $e_{i-1, j} \leq e_{k l}$ by the definition of Lyndon-Shirshov monomials. Hence $w$ is not $R_{+}$-reduced by II.
Case 2. $u=e_{k l}, v=e_{m+n, i} e_{m+n, j} \quad(i>j, k \geq l):$
Since $u v$ is Lyndon-Shirshov, we have $k=m+n$ and $l \geq i$. Then $w$ is not $R_{+}$-reduced by V , since $\bar{w}$ contains $\overline{e_{m+n, i}\left(e_{m+n, i} e_{m+n, i-1}\right)}$ as a subword.

Case 3. $u=e_{m+n, i} e_{m+n, j}, v=e_{k l} \quad(i>j, k \geq l):$
Since $u v$ is Lyndon-Shirshov, we have $e_{m+n, i}>e_{k l} \geq e_{m+n, j}$. It follows that $k=m+n$ and $i>l \geq j$. Hence $\bar{w}$ contains $\overline{\left\{e_{m+n, i} e_{m+n, j} e_{m+n, i-1}\right\}}$ as a subword, and $w$ is not $R_{+}$-reduced by VI.

Case 4. $u=e_{m+n, i} e_{m+n, j}, v=e_{m+n, k} e_{m+n, l} \quad(i>j, k>l)$ :
Since $u v$ is Lyndon-Shirshov, we have $(i, j)>(k, l)$ and $e_{m+n, j} \leq e_{m+n, k} e_{m+n, l}$. Thus we have $j<k$ and either $i=k>j>l$ or $i>k>j$. If $i=k>j>l$, then $\bar{w}$ contains $\overline{\left(e_{m+n, i} e_{m+n, j}\right)\left(e_{m+n, i} e_{m+n, j-1}\right)}$ as a subword, and $w$ is not $R_{+}$-reduced by VII or VIII. If $i>k>j$, then $\bar{w}$ contains $\overline{\left\{e_{m+n, i} e_{m+n, j} e_{m+n, i-1}\right\}}$ as a subword, and $w$ is not $R_{+}$-reduced by VI.

Now, let $w$ be an $R_{+}$- reduced super-Lyndon-Shirshov monomial in $\mathcal{L}_{E}$. Then $w$ is Lyndon-Shirshov or $w=u u$ with $u$ a Lyndon-Shirshov monomial in $E_{\overline{1}}^{\#}$. If the latter is true, then we have the following three possibilities:
(i) $u=e_{n+k, n-l}(m>k \geq 0, n>l \geq 0)$,
(ii) $u=e_{m+n, j}(1 \leq j \leq n)$,
(iii) $u=e_{m+n, i} e_{m+n, j}(m+n \geq i>n \geq j \geq 1)$.

But the cases (i) and (iii) cannot occur by IV and VII. Therefore the set of $R_{+}$-reduced super-Lyndon-Shirshov monomials is given by

$$
B_{+}=\left\{e_{i j} \mid i \geq j\right\} \cup\left\{e_{m+n, i} e_{m+n, j} \mid i>j\right\} \cup\left\{e_{m+n, j} e_{m+n, j} \mid 1 \leq j \leq n\right\} .
$$

Similarly, we get

$$
B_{-}=\left\{f_{i j} \mid i \geq j\right\} \cup\left\{f_{m+n, i} f_{m+n, j} \mid i>j\right\} \cup\left\{f_{m+n, j} f_{m+n, j} \mid 1 \leq j \leq n\right\}
$$

By Lemma 2.4 $B$ spans $L$. Since $\phi$ and $\psi$ are surjective, we have $\operatorname{card}(B) \geq \operatorname{dim} \operatorname{osp}(2 m+$ $1,2 n)$. But the number of elements of $B$ is $2(m+n)^{2}+m+3 n$, which is equal to the dimension of $\operatorname{osp}(2 m+1,2 n)$. Hence $B$ is a linear basis of $L$ and by Proposition 2.9, $R=R(A, \tau)$ is a Gröbner-Shirshov basis for the Lie superalgebra $L$.

Remark. The proof of Theorem 4.4 shows that the Lie superalgebras $L, \mathcal{G}(A, \tau)$ and $B(m, n)=\operatorname{osp}(2 m+1,2 n)$ are all isomorphic. Hence Theorem 4.4 gives a GröbnerShirshov basis for the Lie superalgebra $B(m, n)=\operatorname{osp}(2 m+1,2 n)$. Our argument also shows that $R(A, \tau)$ is actually a minimal Gröbner-Shirshov basis.

### 4.3 The Lie superalgebras of type $B(0, n)(n>0)$

Let $E_{i j}$ denotes the $(2 n+1) \times(2 n+1)$ matrix whose $(i, j)$-entry is 1 and all the other entries are 0 . Set

$$
\begin{align*}
x_{i} & =E_{i+1, i+2}-E_{n+i+2, n+i+1} \quad(1 \leq i \leq n-1) \\
x_{n} & =\sqrt{2}\left(E_{1,2 n+1}+E_{n+1,1}\right)  \tag{4.8}\\
y_{i} & =E_{i+2, i+1}-E_{n+i+1, n+i+2} \quad(1 \leq i \leq n-1) \\
y_{n} & =\sqrt{2}\left(E_{1 n}-E_{2 n+1,1}\right)
\end{align*}
$$

Then the elements $x_{i}, y_{i}, z_{i}=\left[x_{i}, y_{i}\right]$ generate the Lie superalgebra $B(0, n)=\operatorname{osp}(1,2 n)$ $(n>0)$ and $x_{n}, y_{n}$ are the odd generators.

On the other hand, let $\Omega=\{1,2, \ldots n\}, \tau=\{n\} \subset \Omega$, and consider the generalized Cartan matrix $A=\left(a_{i j}\right)_{i, j \in \Omega}$ defined by

$$
\begin{align*}
& a_{n, n}=2, \quad a_{n, n-1}=-2 \\
& a_{i j}=-1 \quad \text { if }|i-j|=1,(i, j) \neq(n, n-1)  \tag{4.9}\\
& a_{i j}=0 \quad \text { if }|i-j|>1
\end{align*}
$$

Let $\mathcal{G}=\mathcal{G}(A, \tau)$ be the Kac-Moody superalgebra associated with $(A, \tau)$ and denote by $e_{i}$, $f_{i}, h_{i}(i=1,2, \cdots, n)$ the generators of $\mathcal{G}$. Then, by the same argument as in the proof of Lemma 4.3, we obtain:

Lemma 4.5 In the Kac-Moody superalgebra $\mathcal{G}=\mathcal{G}(A, \tau)$, we have

$$
\begin{align*}
& e_{i j} e_{k l}=\delta_{j-1, k} e_{i l} \quad \text { if }(i, j) \geq(k, l), n>k, \\
& {\left[e_{n i} e_{n j} e_{n k}\right]=0 \quad(i, j, k \in \Omega)}  \tag{4.10}\\
& \left(e_{n i} e_{n j}\right)\left(e_{n k} e_{n l}\right)=0 \quad(i, j, k, l \in \Omega)
\end{align*}
$$

Let $X=E \cup H \cup F=\left\{e_{i}, h_{i}, f_{i} \mid i \in \Omega\right\}$ be a $\mathbb{Z}_{2}$-graded set, where $\Omega=\{1,2, \cdots, n\}$ and $\tau=\{n\} \subset \Omega$ is the set of odd index. Let $R_{+}$be the set of relations in $E^{\#}$ given by:
I. $e_{i} e_{j} \quad(n \geq i>j+1>1)$,
II. $e_{i j} e_{i-1} \quad(n \geq i>j \geq 1)$,
III. $e_{i j} e_{i, j-1} \quad(n>i \geq j>1)$,
IV. $\left[e_{n, i} e_{n, j} e_{n, j-1}\right] \quad(n \geq i \geq j>1)$,
V. $\left\{e_{n, i} e_{n, j} e_{n, i-1}\right\} \quad(n \geq i>j \geq 1)$,
VI. $\left(e_{n, i} e_{n, j}\right)\left(e_{n, i} e_{n, j-1}\right) \quad(n \geq i>j>1)$.

Let $R_{-}$be the set of relations in $F^{\#}$ obtained by replacing $e_{i j}$ 's in $R_{+}$by $f_{i j}$ 's, and let $R(A, \tau)=R_{+} \cup W \cup R_{-}$. Consider the Lie superalgebra $L=\mathcal{L}_{X} /\langle R(A, \tau)\rangle$. Then there is a surjective Lie superalgebra homomorphism $\psi: L \rightarrow \mathcal{G}$, and using the same argument as in the proof of Theorem 4.4, we obtain:

Theorem 4.6 The set $R(A, \tau)$ of the relations in $\mathcal{L}_{X}$ is a Gröbner-Shirshov basis for the Lie superlagebra L.

Remark. The set of $R_{+}$-reduced super-Lyndon-Shirshov monomials in $\mathcal{L}_{E}$ is given by

$$
B_{+}=\left\{e_{i j} \mid i \geq j\right\} \cup\left\{e_{n, i} e_{n, j} \mid i \geq j\right\}
$$

and the Lie superalgebras $L, \mathcal{G}(A, \tau)$, and $B(0, n)=\operatorname{osp}(1,2 n)$ are all isomorphic. Moreover, $R(A, \tau)$ is a minimal Gröbner-Shirshov basis.

### 4.4 The Lie superalgebras of type $C(n)(n \geq 2)$

Let $E_{i j}$ denotes the $(2 n+1) \times(2 n+1)$ matrix whose $(i, j)$-entry is 1 and all the other entries are 0. Set

$$
\begin{align*}
& x_{1}=E_{13}-E_{n+2,2} \\
& x_{i}=E_{i+1, i+2}-E_{n+i+1, n+i} \quad(2 \leq i \leq n-1), \\
& x_{n}=E_{n+1,2 n}  \tag{4.11}\\
& y_{1}=E_{31}+E_{2, n+2} \\
& y_{i}=E_{i+2, i+1}-E_{n+i, n+i+1} \quad(2 \leq i \leq n-1), \\
& y_{n}=E_{2 n, n+1}
\end{align*}
$$

Then the elements $x_{i}, y_{i}, z_{i}=\left[x_{i}, y_{i}\right](i=1,2, \cdots, n)$ are the generators of the Lie superalgebra $C(n)=\operatorname{osp}(2,2 n-2)$, and $x_{1}, y_{1}$ are the odd generators.

Let $\Omega=\{1,2, \ldots n\}, \tau=\{1\} \subset \Omega$ and consider the generalized Cartan matrix $A=\left(a_{i j}\right)_{i, j \in \Omega}$ defined by

$$
\begin{align*}
& a_{11}=0, \quad a_{12}=1, \quad a_{n-1, n}=-2 \\
& a_{i j}=-1 \quad \text { if }|i-j|=1, \quad(i, j) \neq(1,2),(n-1, n),  \tag{4.12}\\
& a_{i j}=0 \quad \text { if }|i-j|>1
\end{align*}
$$

Let $\mathcal{G}=\mathcal{G}(A, \tau)$ be the Kac-Moody superalgebra associated with $(A, \tau)$ and denote by $e_{i}, f_{i}, h_{i}(i=1,2, \cdots, n)$ the generators of $\mathcal{G}$. Then there is a surjective Lie superalgebra homomorphism $\phi: \mathcal{G} \rightarrow \operatorname{osp}(2,2 n-2)$ given by $e_{i} \mapsto x_{i}, f_{i} \mapsto y_{i}, h_{i} \mapsto z_{i}(i=1,2, \cdots, n)$.

By a similar argument in the proof of Lemma 4.3, we can derive a more refined set of relations in $\mathcal{G}$, which gives a Gröbner-Shirshov basis for the Lie superalgebra $\operatorname{osp}(2,2 n-2)$ ( $n \geq 2$ ). Since the argument is a variation of the one given in Lemma 4.3, we omit the proof here.

Lemma 4.7 In the Kac-Moody superalgebra $\mathcal{G}=\mathcal{G}(A, \tau)$, we have

$$
\begin{align*}
& e_{i j} e_{k l}=\delta_{j-1, k} e_{i l} \quad \text { if }(i, j) \geq(k, l) \text { and } k \neq n-1 \text { when } i=n, \\
& \left\{e_{n i} e_{n-1, j} e_{n-1, k}\right\}=0 \quad(n>i) \\
& \left\{e_{n i} e_{n-1, j} e_{n k}\right\}=0 \quad(i, j, k \in \Omega)  \tag{4.13}\\
& \left(e_{n i} e_{n-1, j}\right)\left(e_{n, k} e_{n-1, l}\right)=0 \quad(i, j, k, l \in \Omega)
\end{align*}
$$

Let $X=E \cup H \cup F=\left\{e_{i}, h_{i}, f_{i} \mid i \in \Omega\right\}$ be a $\mathbb{Z}_{2}$-graded set, where $\Omega=\{1,2, \cdots, n\}$ and $\tau=\{1\} \subset \Omega$ is the set of odd index. Let $R_{+}$be the set of relations in $E^{\#}$ given by:
I. $e_{i} e_{j}(n \geq i>j+1>1)$,
II. $e_{i j} e_{i-1}(n>i>j \geq 1)$,
III. $e_{i j} e_{i, j-1}(n \geq i \geq j>1)$,
IV. $e_{i 1} e_{i 1} \quad(n \geq i \geq 1)$,
V. $\left\{e_{n, i} e_{n-1, j} e_{n-1}\right\} \quad(n>j \geq i \geq 1)$,
VI. $\left\{e_{n, i} e_{n-1, j} e_{n, i-1}\right\} \quad(n>j \geq i>1)$,
VII. $\left[e_{n, i} e_{n, i} e_{n-1}\right] \quad(n \geq i>1)$,
VIII. $\left(e_{n, 1} e_{n-1, j}\right)\left(e_{n, 1} e_{n-1, j}\right) \quad(n>j>1)$,
IX. $\quad\left(e_{n, i} e_{n-1, j}\right)\left(e_{n, i} e_{n-1, j-1}\right) \quad(n>j>i>1)$.

Let $R_{-}$be the set of relations in $F^{\#}$ obtained by replacing $e_{i j}$ 's in $R_{+}$by $f_{i j}$ 's, and let $R(A, \tau)=R_{+} \cup W \cup R_{-}$. Consider the Lie superalgebra $L=\mathcal{L}_{X} /\langle R(A, \tau)\rangle$. Then there is a surjective Lie superalgebra homomorphism $\psi: L \rightarrow \mathcal{G}$ defined by $e_{i} \mapsto e_{i}, f_{i} \mapsto f_{i}$, $h_{i} \mapsto h_{i}(i \in \Omega)$. Moreover, we have:

Theorem 4.8 The set $R(A, \tau)$ of the relations in $\mathcal{L}_{X}$ is a Gröbner-Shirshov basis for the Lie superalgebra $L$.

Proof. Since our argument is similar to the one for the proof of Theorem 4.4, we just give a sketch of the proof. We first prove that the set of $R(A, \tau)$-reduced Lyndon-Shirshov monomials in $\mathcal{L}_{X}$ is given by

$$
B_{+}^{\prime}=\left\{e_{i j} \mid i \geq j\right\} \cup\left\{e_{n, i} e_{n-1, j} \mid n>j \geq i \geq 1 \text { and }(i, j) \neq(1,1)\right\}
$$

and conclude the set $B_{+}$of $R_{+}$-reduced super-Lyndon-Shirshov monomials in $\mathcal{L}_{E}$ is equal to $B_{+}^{\prime}$.

We see that $B=B_{+} \cup H \cup B_{-}$spans $L$, where

$$
B_{-}=\left\{f_{i j} \mid i \geq j\right\} \cup\left\{f_{n, i} f_{n-1, j} \mid n>j \geq i \geq 1 \text { and }(i, j) \neq(1,1)\right\}
$$

is the set of $R_{-}$-reduced super-Lyndon-Shirshov monomials in $\mathcal{L}_{F}$. The number of elements in $B$ is $2 n^{2}+n-2$, which is equal to the dimension of $\operatorname{osp}(2,2 n-2)(n \geq 2)$. Hence the homomorphisms $\phi$ and $\psi$ are isomorphisms, and $B$ is a linear basis of $L$, which proves our assertion.

Remark. The Lie superalgebras $L, \mathcal{G}(A, \tau)$, and $C(n)=\operatorname{osp}(2,2 n-2)$ are all isomorphic and $R(A, \tau)$ is a minimal Gröbner-Shirshov basis.

### 4.5 The Lie superalgebras of type $D(m, n)(m \geq 2, n>0)$

Let $E_{i j}$ denotes the $(2 m+2 n) \times(2 m+2 n)$ matrix whose $(i, j)$-entry is 1 and all the other entries are 0. Set

$$
\begin{align*}
& x_{i}=E_{2 m+i, 2 m+i+1}-E_{2 m+n+i+1,2 m+n+i} \quad(1 \leq i \leq n-1) \\
& x_{n}=E_{2 m+n, 1}+E_{m+1,2 m+2 n} \\
& x_{n+i}=E_{i, i+1}-E_{m+i+1, m+i} \quad(1 \leq i \leq m-1) \\
& x_{m+n}=E_{m, 2 m-1}-E_{m-1,2 m}  \tag{4.14}\\
& y_{i}=E_{2 m+i+1,2 m+i}-E_{2 m+n+i, 2 m+n+i+1} \quad(1 \leq i \leq n-1) \\
& y_{n}=E_{1,2 m+n}-E_{2 m+2 n, m+1} \\
& y_{n+i}=E_{i+1, i}-E_{m+i, m+i+1} \quad(1 \leq i \leq m-1) \\
& y_{m+n}=E_{2 m-1, m}-E_{2 m, m-1}
\end{align*}
$$

Then the elements $x_{i}, y_{i}, z_{i}=\left[x_{i}, y_{i}\right](i=1,2, \cdots, m+n)$ are the generators of the Lie superalgebra $D(m, n)=\operatorname{osp}(2 m, 2 n)$, and $x_{n}, y_{n}$ are the odd generators.

Let $\Omega=\{1,2, \ldots m+n\}, \tau=\{n\}$, and consider the generalized Cartan matrix $A=\left(a_{i j}\right)_{i, j \in \Omega}$ defined by

$$
\begin{gather*}
a_{n n}=0, \quad a_{n, n+1}=1, \quad a_{m+n-2, m+n}=-1, \\
a_{m+n-1, m+n}=0 \quad a_{m+n, m+n-2}=-1, \quad a_{m+n, m+n-1}=0, \\
a_{i j}=-1 \quad \text { if }|i-j|=1, \quad \text { and }(i, j) \neq(n, n+1),  \tag{4.15}\\
(m+n-1, m+n),(m+n, m+n-1), \\
a_{i j}=0 \quad \text { if }|i-j|>1, \quad \text { and }(i, j) \neq(m+n-2, m+n), \\
(m+n, m+n-2) .
\end{gather*}
$$

Let $\mathcal{G}=\mathcal{G}(A, \tau)$ be the Kac-Moody superalgebra associated with $(A, \tau)$ and denote by $e_{i}, f_{i}, h_{i}(i=1,2, \cdots, m+n)$ the generators of $\mathcal{G}$. Then there is a surjective Lie superalgebra homomorphism $\phi: \mathcal{G} \rightarrow \operatorname{osp}(2 m, 2 n)$ given by $e_{i} \mapsto x_{i}, f_{i} \mapsto y_{i}, h_{i} \mapsto z_{i}$ $(i=1,2, \cdots, m+n)$.

We modify some of our notations:
(i) We neglect $e_{m+n, m+m-1}$; if $j \leq m+n-2$, we write $e_{m+n, j}=e_{m+n} e_{m+n-2, j}$.
(ii) We introduce a modified Kronecker's delta:

$$
\hat{\delta}_{i j}= \begin{cases}1 & \text { if } i=j \text { or } i=j+1=m+n-1 \\ 0 & \text { otherwise }\end{cases}
$$

In the following lemma, we will list a set of relations in $\mathcal{G}$ which would yield a GröbnerShirshov basis for the Lie superalgebra $D(m, n)=\operatorname{osp}(2 m, 2 n)(m \geq 2, n>0)$. We will omit the proof which is similar to that of Lemma 4.3.

Lemma 4.9 In the Kac-Moody superalgebra $\mathcal{G}=\mathcal{G}(A, \tau)$, we have

$$
\begin{align*}
& e_{i j} e_{k l}=\hat{\delta}_{j-1, k} e_{i l} \quad \text { if }(i, j) \geq(k, l),(i, k) \neq(m+n, m+n-1), \\
& e_{m+n, i} e_{m+n-1, i}=0 \quad \text { if } i>n, \\
& e_{m+n, i} e_{m+n-1, i-1}=e_{m+n, i-1} e_{m+n-1, i} \quad \text { if } i \leq n,  \tag{4.16}\\
& \left\{e_{m+n, i} e_{m+n-1, j} e_{m+n-1, k}\right\}=0 \quad(i, j, k \in \Omega) \\
& \left\{e_{m+n, i} e_{m+n-1, j} e_{m+n, k}\right\}=0 \quad(i, j, k \in \Omega) \\
& \left(e_{m+n, i} e_{m+n-1, j}\right)\left(e_{m+n, k} e_{m+n-1, l}\right)=0 \quad(i, j, k, l \in \Omega)
\end{align*}
$$

Let $X=E \cup H \cup F=\left\{e_{i}, h_{i}, f_{i} \mid i \in \Omega\right\}$ be a $\mathbb{Z}_{2}$-graded set, where $\Omega=\{1,2, \cdots, n\}$ and $\tau=\{1\} \subset \Omega$ is the set of odd index. Let $R_{+}$be the set of relations in $E^{\#}$ given by:

$$
\begin{aligned}
\text { I. } & e_{i} e_{j}(i>j+1,(i, j) \neq(m+n, m+n-2)), e_{m+n} e_{m+n-1}, \\
\text { II. } & e_{i j} e_{i-1}(m+n>i>j), \quad e_{m+n, j} e_{m+n-2}(m+n-2 \geq j), \\
\text { III. } & e_{i j} e_{i, j-1}(i \geq j>1) \text { with } j \leq m+n-2 \text { when } i=m+n, \\
& e_{m+n}\left(e_{m+n} e_{m+n-2}\right), \\
\text { IV. } & e_{m+n, i} e_{m+n-1, i}(m+n-2 \geq i>n), \\
& e_{m+n, i} e_{m+n-1, i-1}-e_{m+n, i-1} e_{m+n-1, i}(i \leq n), \\
\text { V. } & e_{n+k, n-l} e_{n+k, n-l}(m \geq k \geq 0, n>l \geq 0), \\
\text { VI. } & \left\{e_{m+n, i} e_{m+n-1, j} e_{m+n-1}\right\}(i<j<m+n), \\
& \left\{e_{m+n, i} e_{m+n-1, i} e_{m+n-1}\right\}(i \leq n), \\
\text { VII. } & \left\{e_{m+n, i} e_{m+n, i} e_{m+n-1}\right\}(m+n-2 \geq i), \\
\text { VIII. } & \left\{e_{m+n, i} e_{m+n-1, j} e_{m+n, i-1}\right\}(1<i<j<m+n), \\
& \left\{e_{m+n, i} e_{m+n-1, i} e_{m+n, i-1}\right\}(i \leq n), \\
\text { IX. } & \left(e_{m+n, i} e_{m+n-1, j}\right)\left(e_{m+n, i} e_{m+n-1, j-1}\right)(n+1<i+1<j<m+n), \\
& \left(e_{m+n, i} e_{m+n-1, j}\right)\left(e_{m+n, i} e_{m+n-1, j}\right)(i \leq n, i<j) .
\end{aligned}
$$

Let $R_{-}$be the set of relations in $F^{\#}$ obtained by replacing $e_{i j}$ 's by $f_{i j}$ 's in $R_{+}$, and let $R(A, \tau)=R_{+} \cup W \cup R_{-}$. Consider the Lie superalgebra $L=\mathcal{L}_{X} /\langle R(A, \tau)\rangle$. Then there is a surjective Lie superalgebra homomorphism $\psi: L \rightarrow \mathcal{G}$ defined by $e_{i} \mapsto e_{i}, f_{i} \mapsto f_{i}$, $h_{i} \mapsto h_{i}(i \in \Omega)$, and we have:

Theorem 4.10 The set $R(A, \tau)$ of the relations in $\mathcal{L}_{X}$ is a Gröbner-Shirshov basis for the Lie superalgebra $L$.

Proof. As in the case of $C(n)=\operatorname{osp}(2,2 n-2)$, we only give a brief sketch of the proof here. The set of $R_{ \pm}$-reduced super-Lyndon-Shirshov monomials in $\mathcal{L}_{E}\left(\right.$ resp. $\left.\mathcal{L}_{F}\right)$ is given by

$$
\begin{aligned}
& B_{+}=\left\{e_{i j} \mid i \geq j\right\} \cup\left\{e_{m+n, i} e_{m+n-1, j} \mid i<j \text { or } i=j \leq n\right\} \\
& B_{-}=\left\{f_{i j} \mid i \geq j\right\} \cup\left\{f_{m+n, i} f_{m+n-1, j} \mid i<j \text { or } i=j \leq n\right\}
\end{aligned}
$$

Hence the number of elements in the set of $R(A, \tau)$-reduced super-Lyndon-Shirshov monomials in $\mathcal{L}_{X}$ is $2(m+n)^{2}-m+n$, which is equal to the dimension of the Lie superalgebra $D(m, n)=\operatorname{osp}(2 m, 2 n)$. Therefore, $B$ is a linear basis of $L$ and $R(A, \tau)$ is a GröbnerShirshov basis for $L$.

Remark. The Lie superalgebras $L, \mathcal{G}(A, \tau)$, and $D(m, n)=\operatorname{osp}(2 m, 2 n)$ are all isomorphic and $R(A, \tau)$ is a minimal Gröbner-Shirshov basis.
