## Automated Generation of Illustrations for Synthetic Geometry Proofs

Predrag Janičić University of Belgrade, Serbia Julien Narboux University of Strasbourg, France

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 - のへで

ADG 2021, virtual/Hagenberg, Austria, September 15-17, 2021.

- In mathematics, especially geometry, illustrations are often very valuable, but almost always just an informal content
- Links between proofs and illustrations are loose
- However, proofs, in some cases, can carry information for illustrations

◆□▶ ◆□▶ ◆三▶ ◆三▶ ・三 ・ 少々ぐ

- Visualization of statements:
  - using algebraic methods and computations (Gao, Wang)
  - within dynamic geometry tools (GeoGebra etc)
- Visualization of proofs:
  - Full angle method (Wilson and Fleuriot)
  - JGEX algebraic methods (Ye et. al.)
  - PCoq : heuristic for constraint solving
  - Some of the above do not support introducing new points
- In all approaches: visualization rules are hard-coded

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ● □ ● ○ ○ ○ ○

• A FOL formula is said to be *coherent* if it is of the form:

 $A_1(\vec{x}) \land \ldots \land A_n(\vec{x}) \Rightarrow \exists \vec{y} (B_1(\vec{x}, \vec{y}) \lor \ldots \lor B_m(\vec{x}, \vec{y}))$ 

where universal closure is assumed,  $A_i$  denote atomic formulae,  $B_i$  denote conjunctions of atomic formulae

- CL is simple, allows simple forward chaining proofs
- Human-readable, natural language proofs but also machine verifiable proofs can be easily obtained
- Any first-order theory can be translated into CL
- $\bullet$  Several automated theorem provers for CL, one recent: Larus  $(Janičić/Narboux)^1$

<sup>1</sup>https://github.com/janicicpredrag/Larūs/+♂→ < ≧ → < ≧ → へ 4/17 Janičić, Narboux Illustrations for Geometry Proofs Consider the following set of axioms: ax1:  $\forall x \ (p(x) \Rightarrow r(x) \lor q(x))$ ax2:  $\forall x \ (q(x) \Rightarrow \bot)$ and the following conjecture that can be proved as a CL theorem:  $\forall x \ (p(x) \Rightarrow r(x))$ 

Consider arbitrary a such that: p(a). It should be proved that r(a).

- 1.  $r(a) \lor q(a)$  (by MP, from p(a) using axiom ax1; instantiation:  $X \mapsto a$ )
- 2. Case r(a):
- 3. Proved by assumption! (by QEDas)
- 4. Case q(a):
- 5.  $\perp$  (by MP, from q(a) using axiom ax2; instantiation:  $X \mapsto a$ )
- 6. Contradiction! (by QEDefq)
- 7. Proved by case split! (by QEDcs, by r(a), q(a))

▲□▶ ▲圖▶ ▲国▶ ▲国▶ - 国 - のへの

- If we know how to visually interpret proof steps that introduce new objects or facts, we can produce a complete illustration
- The illustration is based on a sequence of such objects in one universum (i.e., model)
- A natural choice for the universum is Cartesian space
- This idea is well-suited to CL and to forward chaining proofs

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ = 臣 = のへで

• Consider the axiom:

 $\forall x, y \ (point(x) \land point(y) \Rightarrow \exists z \ between(x, z, y))$ 

- It may have attached the visual interpretation:
   ,,for two Cartesian points a and b, a Cartesian point c is created as the midpoint of ab"
- If the axiom is applied to the points *a* and *b*, with associated Cartesian coordinates (2,5) and (4,11), then the new witness point will have the associated Cartesian coordinates (3,8)
- Not only new witnesses can be created, but also some new features can also be illustrated

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへで

- It makes no much sense to illustrate all proof branches
- An illustration is created for at most one proof branch:
  - If all proof branches end with contradiction, then they all belong to some upper contradictory proof branch, and we illustrate neither of them.
  - If there are some proof branches that do not end with contradiction, then one that corresponds to the model being built should be illustrated.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ = 臣 = のへで

- How do we start the illustration in the first place?
- We prove theorems of the form:  $A_0(\vec{x}) \land \ldots \land A_{n-1}(\vec{x}) \Rightarrow \exists \vec{y} (B_0(\vec{x}, \vec{y}) \lor \ldots \lor B_{m-1}(\vec{x}, \vec{y}))$
- In order to build the initial illustration we need some constants a such that: A<sub>0</sub>(a) ∧ ... ∧ A<sub>n-1</sub>(a) holds.
- How can we find and illustrate such objects?
- By proving and illustrating the conjecture  $\exists \vec{x}(A_0(\vec{x}) \land \ldots \land A_{n-1}(\vec{x})).$
- If the above conjecture is not theorem, the premises are inconsistent and the statement is trivially valid

イロト イヨト イヨト イヨト ヨー シベル

- The visual interpretation of each theorem can either be
  - provided by the user or
  - produced automatically recursively, using the same approach.
- Ultimately, what we need are only visual interpretations of all axioms, provided by a human.

<ロト < 回 > < 臣 > < 臣 > 三 の < で 10/17

• In order to make illustrations partly unpredictable and more interesting, some randomization may be added to the visual interpretations

◆□▶ ◆□▶ ◆ ミ▶ ◆ ミ▶ ミニックへで 11/17

- We implemented the described method within our automated theorem prover for coherent logic, Larus
- For the target language we chose the GCL language a rich, special purpose language for mathematical, especially geometry illustrations.
- For each axiom, the user has to provide a corresponding visualisation in terms of a GCLC function; for example:

For any two points A and	random r
B, there is a point C such	expression r' {1+r}
that bet(A, B, C)	towards C A B r'

• Step-by-step visuelization (animations) supported

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

## Theorem

proposition\_11 :  $\forall A \; \forall B \; \forall C \; (betS(A, C, B) \Rightarrow \exists X \; (per(A, C, X)))$ 

Proof:

Consider arbitrary a, b, c such that: betS(a, c, b). It should be proved that  $\exists X \ per(a, c, X)$ .

- 1. Let w be such that  $betS(a, c, w) \land cong(c, w, a, c)$  (by MP, from betS(a, c, b), betS(a, c, b) using axiom lemma\_extension)
- Let w1 be such that equilateral(a, w, w1) ∧ triangle(a, w, w1) (by MP, from betS(a, c, w) ∧ cong(c, w, a, c) using axiom proposition\_01)
- 3.  $w1 = c \lor w1 \neq c$  (by MP, using axiom eq\_excluded\_middle)
- 4. Case w1 = c:
- 5. col(a, w, w1) (by MP, from  $betS(a, c, w) \land cong(c, w, a, c), w1 = c$  using axiom colEqSub2)
- 6.  $\perp$  (by MP, from col(a, w, w1), equilateral(a, w, w1)  $\wedge$  triangle(a, w, w1) using axiom nnncolNegElim)
- 7. Contradiction! (by QEDefq)
- 8. Case  $w1 \neq c$ :
- per(a, c, w1) (by MP, from betS(a, c, w) ∧ cong(c, w, a, c), betS(a, c, w) ∧ cong(c, w, a, c), equilateral(a, w, w1) ∧ triangle(a, w, w1), w1 ≠ c using axiom defrightangle2)
- 10. Proved by assumption! (by QEDas)
- 11. Proved by case split! (by QEDcs, by  $w1 = c, w1 \neq c$ )

A code provided by the user:

```
% fof(lemma_extension,axiom, (! [A,B,P,Q] : (? [X] :
                                 ((( A != B ) & ( P != Q )) => ((betS(A,B,X) & cong(B,X,P,Q))))))).
procedure lemma_extension { A B P Q X } {
    distance d1 A B
    distance d2 P Q
    expression r { 1+(d1/d2) }
    towards X A B r
    drawsegment A X
    cmark X
}
```

<ロト (日) (日) (王) (王) (王) (14/17

## Example

A code generated by the prover:

```
% ----- Proof illustration -----
include lemma_extension.gcl
include proposition_01.gcl
include defrightangle2.gcl
include proposition_11_exists.gcl
%-----
procedure proposition_11 { a b c w } {
 call lemma extension \{a c a c w\}
 mark t w
 call proposition_01 { a w w1 }
 mark t w1
 % --- Illustration for branch 2
 call defrightangle2 { a c w1 w }
}
%-----
call proposition_11_exists { a b c }
call proposition_11 { a b c w }
```

## CL and Geometry Illustrations - Example

Four steps in illustration of the proposition 11

999

- The approach is a sort of constraint solving based on theorem proving
- Proofs of existence depend on the axioms provided (for instance, an axiom that enables angle trisection)
- The approach is:

simple as it is a small extension to a CL prover modular as all illustrations rely only on visual interpretations of axioms used flexible as one can provide different visual counterparts of the axioms, but also of particular lemmas used

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <
