

# Commutative Algebra and Algebraic Geometry

Lecture Notes  
Johannes Kepler Universität Linz

Summer 2012

Prof. Franz Winkler

## Contents

1. Introduction .....	1
2. Elimination theory .....	9
2.1 Existence and construction of Gröbner bases .....	9
2.2 Solving ideal theoretic problems by Gröbner bases .....	17
2.3 Basis conversion for 0-dimensional ideals — FGLM .....	23
2.4 Resultants .....	32
3. Affine algebraic sets and varieties .....	35
3.1 Affine space and algebraic sets .....	35
3.2 Noetherian rings and Hilbert's Basis Theorem .....	41
3.3 Irreducible components of algebraic sets .....	44
4. The algebraic-geometric correspondence .....	49
4.1 The geometry of elimination .....	49
4.2 Hilbert's Nullstellensatz .....	53
4.3 Primary decomposition of ideals .....	57
5. Projective algebraic sets and varieties .....	61
5.1 Projective space .....	61
5.2 Homogeneous ideals and projective algebraic sets .....	66
6. Functions and mappings on varieties .....	75
6.1 Coordinate rings, polynomial functions and mappings .....	75
6.2 Rational functions and local rings .....	82
7. Local properties of plane algebraic curves .....	87
7.1 Singularities and tangents .....	87
7.2 Intersection of plane curves .....	97
7.3 Linear systems and divisors .....	106
8. Rational parametrization of curves .....	113
8.1 Rational curves and parametrizations .....	113
8.2 Proper parametrizations .....	121
8.3 Parametrization by lines .....	127
8.4 Parametrization by adjoint curves .....	134

9. Local parametrization and Puiseux expansion .....	143
9.1 Power series, places, and branches .....	145
9.2 Puiseux's theorem and the Newton polygon method .....	150
10. Dimension and Hilbert function .....	157
10.1 An algebraic definition of dimension .....	157
10.2 The Hilbert function .....	161
References .....	169

## Preface

*Commutative algebra* is the theory of polynomial ideals. Problems concerning polynomial ideals are representation of ideals, e.g. by Gröbner bases or characteristic sets, decomposition of ideals into prime and primary ideals, determination of radical ideals, dimension and height of ideals, the structure of polynomial rings modulo ideals, solution of systems of polynomial equations, solution of linear systems with polynomial coefficients, i.e. computation of syzygies, etc. Constructive methods for answering such questions are provided by computer algebra, e.g. algorithms for computation of greatest common divisors, factorization, computation of Gröbner bases, resultants.

This theory of polynomial ideals can be generalized to vectors of polynomials, leading to modules over polynomial rings.

*Algebraic geometry* traditionally is the study of sets of solutions of systems of polynomial equations, i.e. of algebraic sets. We might be interested in the dimension of an algebraic set, its irreducible components, the tangent space at a point, functions on algebraic sets, different representations such as local or global parametrizations, etc.

Algebraic curves and surfaces are an old topic of geometric and algebraic investigation. They appear in biological shapes, in ancient and modern architectural designs, in number theoretic problems, in error-correcting codes, and in cryptographic algorithms. Recently they have gained additional practical importance as central objects in computer aided geometric design. Modern airplanes, cars, and household appliances would be unthinkable without the computational manipulation of algebraic curves and surfaces. Algebraic curves and surfaces combine fascinating mathematical beauty with challenging computational complexity and wide spread practical applicability.

Obviously commutative algebra and algebraic geometry are closely related. We will investigate some of these relations. For further reading on the topics of this course we suggest the books by Sendra, Winkler, Pérez-Díaz [SWP08], Cox, Little, O’Shea [CLO97], [CLO98], Fulton [Ful69], Reid [Rei88], and Walker [Wal50]. As good introductions to commutative algebra we suggest the books by Zariski, Samuel [ZaS58] and Kunz [Kun85]. For computational methods on polynomials we refer to the books by Winkler [Win96] and Kreuzer, Robbiano [KrR00]. Hartshorne [Har77] is a more advanced text on algebraic geometry. The modern language of algebraic geometry is introduced in the book by Eisenbud and Harris [EiH92].
