

Commutative Algebra and Algebraic Geometry

Lecture Notes
Johannes Kepler Universität Linz

Summer 2020

Prof. Franz Winkler

Contents

References	
1. Introduction	1
2. Elimination theory	9
2.1 Existence and construction of Gröbner bases	9
2.2 Solving ideal theoretic problems by Gröbner bases	17
2.3 Basis conversion for 0-dimensional ideals — FGLM	23
2.4 Resultants	32
3. Affine algebraic sets and varieties	35
3.1 Affine space and algebraic sets	35
3.2 Noetherian rings and Hilbert's Basis Theorem	41
3.3 Irreducible components of algebraic sets	44
4. The algebraic-geometric correspondence	49
4.1 The geometry of elimination	49
4.2 Hilbert's Nullstellensatz	53
4.3 Primary decomposition of ideals	57
5. Projective algebraic sets and varieties	61
5.1 Projective space	61
5.2 Homogeneous ideals and projective algebraic sets	66
6. Functions and mappings on varieties	75
6.1 Coordinate rings, polynomial functions and mappings	75
6.2 Rational functions and local rings	82
7. Plane algebraic curves	87
7.1 Singularities and tangents	87
7.2 Intersection of plane curves	97
7.3 Linear systems and divisors	106
8. Rational parametrization of curves	113
8.1 Rational curves and parametrizations	113
8.2 Proper parametrizations	121
8.3 Parametrization by lines	127
8.4 Parametrization by adjoint curves	134

9. Local parametrization and Puiseux expansion	143
9.1 Power series, places, and branches	145
9.2 Puiseux's theorem and the Newton polygon method	150
10. Dimension and Hilbert function	157
10.1 An algebraic definition of dimension	157
10.2 The Hilbert function	161

Preface

Commutative algebra is the theory of polynomial ideals. Problems concerning polynomial ideals are representation of ideals, e.g. by Gröbner bases or characteristic sets, decomposition of ideals into prime and primary ideals, determination of radical ideals, dimension and height of ideals, the structure of polynomial rings modulo ideals, solution of systems of polynomial equations, solution of linear systems with polynomial coefficients, i.e. computation of syzygies, etc. Constructive methods for answering such questions are provided by computer algebra, e.g. algorithms for computation of greatest common divisors, factorization, computation of Gröbner bases, resultants.

This theory of polynomial ideals can be generalized to vectors of polynomials, leading to modules over polynomial rings.

Algebraic geometry traditionally is the study of sets of solutions of systems of polynomial equations, i.e. of algebraic sets. We might be interested in the dimension of an algebraic set, its irreducible components, the tangent space at a point, functions on algebraic sets, different representations such as local or global parametrizations, etc.

Algebraic curves and surfaces are an old topic of geometric and algebraic investigation. They appear in biological shapes, in ancient and modern architectural designs, in number theoretic problems, in error-correcting codes, and in cryptographic algorithms. Recently they have gained additional practical importance as central objects in computer aided geometric design. Modern airplanes, cars, and household appliances would be unthinkable without the computational manipulation of algebraic curves and surfaces. Algebraic curves and surfaces combine fascinating mathematical beauty with challenging computational complexity and wide spread practical applicability.

Obviously commutative algebra and algebraic geometry are closely related. We will investigate some of these relations. For further reading on the topics of this course we suggest the books by Sendra, Winkler, Pérez-Díaz [SWP08], Cox, Little, O'Shea [CLO97], [CLO98], Fulton [Ful69], Reid [Rei88], and Walker [Wal50]. As good introductions to commutative algebra we suggest the books by Zariski, Samuel [ZaS58] and Kunz [Kun85]. For computational methods on polynomials we refer to the books by Winkler [Win96] and Kreuzer, Robbiano [KrR00]. Hartshorne [Har77] is a more advanced text on algebraic geometry. The modern language of algebraic geometry is introduced in the book by Eisenbud and Harris [EiH92].
