#### Motivation Preliminaries Syntactic Unification

# Rewriting Requires Matching

- Rewrite s(0) + s(s(0)) by the rule  $s(x) + y \rightarrow s(x+y)$ .
- Match s(x) + y to s(0) + s(s(0)).

# Completion Requires Unification

- Compute a critical pair between  $f(f(x,y),z) \to f(x,f(y,z))$  and  $h(f(x_1,y_1)) \to f(h(x_1),h(y_1))$ .
- Unify f(f(x,y),z) and  $f(x_1,y_1)$ .

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

#### Motivation Preliminaries Syntactic Unification

# Rewriting Modulo Equalities Requires E-Matching

- Rewrite f(a, f(b, e)) by the rule  $f(e, x) \rightarrow x$ .
- f is commutative.
- Match f(e,x) to f(b,e) modulo commutativity of f.

# Completion Modulo Equalities Requires E-Unification

- Compute a critical pair between  $x \cdot (x^- \cdot z) \to 1$  and  $(y_0 \cdot x_0)^- \to (x_0)^- \cdot (y_0)^-$
- · is associative and commutative.
- AC-unify  $x \cdot (x^- \cdot z)$  and  $y_0 \cdot x_0$ .

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

# Solving Term Equations

- Unification/matching problems: problems of solving equations between terms.
- Used in
  - rewriting
  - automated reasoning
  - logic and functional programming
  - type inference
  - program transformation
  - computational linguistics

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

# Subject of this Course

- Syntactic unification and matching.
- Generalizations to the equational case.
- MUG: Matching, Unification, Generalizations.

Temur Kutsia - MUG - July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

# Motivation Preliminaries Syntactic Unification

### Notation

- First-order language.
- $\mathcal{F}$ : Set of function symbols.
- V: Set of variables.
- x, y, z: Variables.
- a, b, c: Constants.
- f, g, h: Arbitrary function symbols.
- s, t, r: Terms.
- $\mathcal{T}(\mathcal{F}, \mathcal{V})$ : Set of terms over  $\mathcal{F}$  and  $\mathcal{V}$ .
- Equation: a pair of terms, written  $s \doteq t$ .
- vars(t): The set of variables in t. This notation will be used also for sets of terms, equations, and sets of equations.

#### Substitution

• A mapping from variables to terms, where all but finitely many variables are mapped to themselves.

### Example

A substitution is represented as a set of *bindings*:

- $\{x \mapsto f(a,b), y \mapsto z\}.$
- $\{x \mapsto f(x,y), y \mapsto f(x,y)\}.$

All variables except x and y are mapped to themselves by these substitutions.

Temur Kutsia - MUG - July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification

### Substitutions

#### Notation

- $\sigma$ ,  $\vartheta$ ,  $\eta$ ,  $\rho$  denote arbitrary substitutions.
- ullet  $\varepsilon$  denotes the identity substitution.

### Substitution Application

Applying a substitution  $\sigma$  to a term t:

$$t\sigma = \begin{cases} \sigma(x) & \text{if } t = x \\ f(t_1\sigma, \dots, t_n\sigma) & \text{if } t = f(t_1, \dots, t_n) \end{cases}$$

#### Example

- $\sigma = \{x \mapsto f(x,y), y \mapsto g(a)\}.$
- $t = f(\mathbf{x}, g(f(\mathbf{x}, f(\mathbf{y}, \mathbf{z})))).$
- $t\sigma = f(f(x,y), g(f(f(x,y), f(g(a),z)))).$

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification

### Substitutions

#### Domain, Range, Variable Range

For a substitution  $\sigma$ :

• The domain is the set of variables:

$$dom(\sigma) = \{x \mid x\sigma \neq x\}.$$

• The *range* is the set of terms:

$$ran(\sigma) = \bigcup_{x \in dom(\sigma)} \{x\sigma\}.$$

The variable range is the set of variables:

$$vran(\sigma) = vars(ran(\sigma)).$$

### Example (Domain, Range, Variable Range)

$$dom(\{x \mapsto f(a, y), y \mapsto g(z)\}) = \{x, y\}$$

$$ran(\{x \mapsto f(a, y), y \mapsto g(z)\}) = \{f(a, y), g(z)\}$$

$$vran(\{x \mapsto f(a, y), y \mapsto g(z)\}) = \{y, z\}$$

$$dom(\varepsilon) = ran(\varepsilon) = vran(\varepsilon) = \emptyset$$

Temur Kutsia - MUG - July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation
Preliminaries
Syntactic Unification

### Substitutions

#### Restriction

Restriction of a substitution  $\sigma$  on a set of variables  $\mathcal{X}$ :

A substitution  $\sigma|_{\mathcal{X}}$  such that for all x

$$x\sigma|_{\mathcal{X}} = \left\{ \begin{array}{ll} x\sigma & \text{if } x \in \mathcal{X} \\ x & \text{otherwise} \end{array} \right.$$

#### Example

- $\{x \mapsto f(a), y \mapsto x, z \mapsto b\}|_{\{x,y\}} = \{x \mapsto f(a), y \mapsto x\}.$
- $\{x \mapsto f(a), z \mapsto b\}|_{\{x,y\}} = \{x \mapsto f(a)\}.$
- $\bullet \ \{z\mapsto b\}|_{\{x,y\}}=\varepsilon.$

### Composition of Substitutions

- Written:  $\sigma \vartheta$ .
- $t(\sigma \vartheta) = (t\sigma)\vartheta$ .

#### Example

- $\sigma = \{x \mapsto f(y), y \mapsto z\}$
- $\vartheta = \{x \mapsto a, y \mapsto b, z \mapsto y\}$
- $\sigma \vartheta = \{x \mapsto f(b), z \mapsto y\}$

Composition is associative but not commutative:

$$\vartheta \sigma = \{x \mapsto a, y \mapsto b\} \neq \sigma \vartheta.$$

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification

### Substitutions

### Triangular Form

Sequential list of bindings:

$$[x_1 \mapsto t_1; x_2 \mapsto t_2; \dots; x_n \mapsto t_n],$$

represents composition of n substitutions each consisting of a single binding:

$$\{x_1 \mapsto t_1\}\{x_2 \mapsto t_2\} \dots \{x_n \mapsto t_n\}.$$

#### Variable Renaming

A substitution  $\sigma = \{x_1 \mapsto y_1, x_2 \mapsto y_2, \dots, x_n \mapsto y_n\}$  is called *variable renaming* iff

- y's are distinct variables, and
- $\{x_1,\ldots,x_n\} = \{y_1,\ldots,y_n\}.$

(Permuting the domain variables.)

#### Example

- $\{x \mapsto y, y \mapsto z, z \mapsto x\}$  is a variable renaming.
- $\{x\mapsto a\}$ ,  $\{x\mapsto y\}$ , and  $\{x\mapsto z,y\mapsto z\}$  are not.

Temur Kutsia - MUG - July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation
Preliminaries
Syntactic Unification

### Substitutions

### Idempotent Substitution

A substitution  $\sigma$  is *idempotent* iff  $\sigma \sigma = \sigma$ .

### Example

Let  $\sigma = \{x \mapsto f(z), y \mapsto z\}, \ \vartheta = \{x \mapsto f(y), y \mapsto z\}.$ 

- $\sigma$  is idempotent.
- $\vartheta$  is not:  $\vartheta\vartheta = \sigma \neq \vartheta$ .

### Theorem

 $\sigma$  is idempotent iff  $dom(\sigma) \cap vran(\sigma) = \emptyset$ .

#### Proof.

Exercise.

Temur Kutsia - MUG - July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation **Preliminaries** Syntactic Unification

### Substitutions

#### Instantiation Quasi-Ordering

- A substitution  $\sigma$  is *more general* than  $\vartheta$ , written  $\sigma \leq \vartheta$ , if there exists  $\eta$  such that  $\sigma \eta = \vartheta$ .
- The relation ≤ is quasi-ordering (reflexive and transitive binary relation), called *instantiation quasi-ordering*.
- = is the equivalence relation corresponding to ≤.

### Example

Let  $\sigma = \{x \mapsto y\}$ ,  $\rho = \{x \mapsto a, y \mapsto a\}$ ,  $\vartheta = \{y \mapsto x\}$ .

- $\sigma \le \rho$ , because  $\sigma\{y \mapsto a\} = \rho$ .
- $\sigma \leq \vartheta$ , because  $\sigma\{y \mapsto x\} = \vartheta$ .
- $\vartheta \le \sigma$ , because  $\vartheta \{x \mapsto y\} = \sigma$ .
- $\sigma = \vartheta$ .

#### **Theorem**

For any  $\sigma$  and  $\vartheta$ ,  $\sigma = \vartheta$  iff there exists a variable renaming substitution  $\eta$  such that  $\sigma \eta = \vartheta$ .

#### Proof.

Exercise.

### Example

 $\sigma$ ,  $\vartheta$  from the previous example:

- $\sigma = \{x \mapsto y\}.$
- $\vartheta = \{y \mapsto x\}.$
- $\sigma = \vartheta$ .
- $\sigma\{x \mapsto y, y \mapsto x\} = \vartheta$ .

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation
Preliminaries
Syntactic Unification

### Substitutions

### Unifier, Most General Unifier, Unification Problem

- A substitution  $\sigma$  is a *unifier* of the terms s and t if  $s\sigma = t\sigma$ .
- A unifier  $\sigma$  of s and t is a most general unifier (mgu) if  $\sigma \leq \vartheta$  for every unifier  $\vartheta$  of s and t.
- A unification problem for s and t is represented as  $s \doteq t$ .

### Example (Unifier, Most General Unifier)

Unification problem:  $f(x,z) \doteq f(y,g(a))$ .

Some of the unifiers:

$$\{x \mapsto y, z \mapsto g(a)\}$$

$$\{y \mapsto x, z \mapsto g(a)\}$$

$$\{x \mapsto a, y \mapsto a, z \mapsto g(a)\}$$

$$\{x \mapsto f(x, y), y \mapsto f(x, y), z \mapsto g(a)\}$$

- mgu's:  $\{x \mapsto y, z \mapsto g(a)\}$ ,  $\{y \mapsto x, z \mapsto g(a)\}$ .
- mgu is unique up to a variable renaming:

$$\{x \mapsto y, z \mapsto g(a)\} = \{y \mapsto x, z \mapsto g(a)\}$$

Motivation Preliminaries Syntactic Unification **Unification**Matching
Improving the Unification Algorithm

# Unification Algorithm

- Goal: Design an algorithm that for a given unification problem  $s \doteq t$ 
  - ullet returns an mgu of s and t if they are unifiable,
  - reports failure otherwise.

### Naive Algorithm

Write down two terms and set markers at the beginning of the terms. Then:

- Move the markers simultaneously, one symbol at a time, until both move off the end of the term (success), or until they point to two different symbols;
- 2 If the two symbols are both non-variables, then **fail**; otherwise, one is a variable (call it x) and the other one is the first symbol of a subterm (call it t):
  - If x occurs in t, then **fail**;
  - Otherwise, replace x everywhere from the marker positions by t(including in the solution), write down " $x \mapsto t$ " as a part of the solution, and return to 1.

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Syntactic Unification

Unification Improving the Unification Algorithm

### Naive Algorithm

- Finds disagreements in the two terms to be unified.
- Attempts to repair the disagreements by binding variables to terms.
- Fails when function symbols clash, or when an attempt is made to unify a variable with a term containing that variable.

# Interesting Questions

#### Correctness:

- Does the algorithm always terminate?
- Does it always produce an mgu for two unifiable terms, and fail for non-unifiable terms?
- Do these answers depend on the order of operations?

#### Implementation:

- What data structures should be used for terms and substitutions?
- How should application of a substitution be implemented?
- What order should the operations be performed in?

#### Complexity:

How much space does this take, and how much time?

Improving the Unification Algorithm

# The Inference System ${\cal U}$

• A set of equations in *solved form*:

$$\{x_1 \doteq t_1, \dots, x_n \doteq t_n\}$$

where each  $x_i$  occurs exactly once.

- For each idempotent substitution there exists exactly one set of equations in solved form.
- Notation:
  - $[\sigma]$  for the solved form set for an idempotent substitution  $\sigma$ .
  - $\sigma_S$  for the idempotent substitution corresponding to a solved form set S.

# The Inference System ${\cal U}$

- System: The symbol  $\bot$  or a pair P;S where
  - *P* is a set of unification problems,
  - ullet S is a set of equations in solved form.
- 1 represents failure.
- A unifier (or a solution) of a system P; S: A substitution that unifies each of the equations in P and S.
- \( \text{has no unifiers.} \)

Matching
Improving the Unification Algorithm

# The Inference System ${\cal U}$

**Orient:**  $\{t \doteq^? x\} \cup P'; S \Longrightarrow \{x \doteq^? t\} \cup P'; S,$ 

if t is not a variable.

Occurs Check:  $\{x \doteq^? t\} \cup P'; S \Longrightarrow \bot$ 

if  $x \in vars(t)$  but  $x \neq t$ .

**Variable Elimination:**  $\{x \doteq^? t\} \cup P'; S \Longrightarrow$ 

 $P'\{x \mapsto t\}; S\{x \mapsto t\} \cup \{x \doteq t\},\$ 

if  $x \notin vars(t)$ .

### Unification with ${\cal U}$

In order to unify s and t:

- ① Create an initial system  $\{s \doteq^? t\}; \varnothing$ .
- **2** Apply successively rules from  $\mathcal{U}$ .

The system  $\mathcal{U}$  is essentially the Herbrand's Unification Algorithm.

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification Unification
Matching
Improving the Unification Algorithm

# Properties of U: Termination

#### Lemma

For any finite set of equations P, every sequence of transformations in  $\mathcal U$ 

$$P; \varnothing \Longrightarrow P_1; S_1 \Longrightarrow P_2; S_2 \Longrightarrow \cdots$$

terminates either with  $\bot$  or with  $\varnothing; S$ , with S in solved form.

### Properties of U: Termination

#### Proof.

Complexity measure on the sets of equations:  $\langle n_1, n_2, n_3 \rangle$ , ordered lexicographically on triples of naturals, where

 $n_1$  = The number of distinct variables in P.

 $n_2$  = The number of symbols in P.

 $n_3$  = The number of equations in P of the form  $t \doteq x$  where t is not a variable.

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification Unification
Matching
Improving the Unification Algorithm

# Properties of $\mathcal{U}$ : Termination

### Proof [Cont.]

Each rule in  $\ensuremath{\mathcal{U}}$  strictly reduces the complexity measure.

Rule	$n_1$	$n_2$	$n_3$
Trivial	>	>	
Decomposition	=	>	
Orient	=	=	>
Variable Elimination	>		

# Properties of U: Termination

### Proof [Cont.]

- A rule can always be applied to a system with non-empty P.
- The only systems to which no rule can be applied are  $\bot$  and  $\varnothing; S$ .
- Whenever an equation is added to S, the variable on the left-hand side is eliminated from the rest of the system, i.e.  $S_1, S_2, \ldots$  are in solved form.

#### Corollary

If  $P; \varnothing \Longrightarrow^+ \varnothing; S$  then  $\sigma_S$  is idempotent.

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification Unification
Matching

# Properties of $\mathcal{U}$ : Correctness

Notation:  $\Gamma$  for systems.

#### Lemma

For any transformation  $P; S \Longrightarrow \Gamma$ , a substitution  $\vartheta$  unifies P; S iff it unifies  $\Gamma$ .

# Properties of U: Correctness

#### Proof.

Occurs Check: If  $x \in vars(t)$  and  $x \neq t$ , then

- x contains fewer symbols than t,
- $x\vartheta$  contains fewer symbols than  $t\vartheta$  (for any  $\vartheta$ ).

Therefore,  $x\vartheta$  and  $t\vartheta$  can not be unified.

**Variable Elimination:** From  $x\theta = t\theta$ , by structural induction on u:

$$u\vartheta = u\{x \mapsto t\}\vartheta$$

for any term, equation, or set of equations u. Then

$$P'\vartheta = P'\{x \mapsto t\}\vartheta, \qquad S'\vartheta = S'\{x \mapsto t\}\vartheta.$$

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification Unification Matching Improving the Unification Algorithm

# Properties of $\mathcal{U}$ : Correctness

### Theorem (Soundness)

If  $P; \varnothing \Longrightarrow^+ \varnothing; S$ , then  $\sigma_S$  unifies any equation in P.

#### Proof.

By induction on the length of derivation, using the previous lemma and the fact that  $\sigma_S$  unifies S.

# Properties of U: Correctness

### Theorem (Completeness)

If  $\vartheta$  unifies every equation in P, then any maximal sequence of transformations  $P; \varnothing \Longrightarrow \cdots$  ends in a system  $\varnothing; S$  such that  $\sigma_S \leq \vartheta$ .

#### Proof.

Such a sequence must end in  $\emptyset$ ; S where  $\vartheta$  unifies S (why?). For every binding  $x \mapsto t$  in  $\sigma_S$ ,  $x\sigma_S\vartheta = t\vartheta = x\vartheta$  and for every  $x \notin dom(\sigma_S)$ ,  $x\sigma_S\vartheta = x\vartheta$ . Hence,  $\vartheta = \sigma_S\vartheta$ .

#### Corollary

If P has no unifiers, then any maximal sequence of transformations from  $P; \varnothing \text{ must have the form } P; \varnothing \Longrightarrow \bot$ .

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification Unification Matching Improving the Unification Algorithm

# **Observations**

- ullet Computes an idempotent mgu.
- The choice of rules in computations via  $\mathcal{U}$  is "don't care" nondeterminism (the word "any" in Completeness Theorem).
- Any control strategy will result to an mgu for unifiable terms, and failure for non-unifiable terms.
- ullet Any practical algorithm that proceeds by performing transformations of  ${\cal U}$  in any order is
  - sound and complete,
  - generates mgus for unifiable terms.
- Not all transformation sequences have the same length.
- Not all transformation sequences end in exactly the same mgu.

### Matcher, Matching Problem

- A substitution  $\sigma$  is a *matcher* of s to t if  $s\sigma = t$ .
- A matching problem between s and t is represented as  $s \ll^? t$ .

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification Unification
Matching
Improving the Unification Algorithm

# Matching vs Unification

### Example

$f(x,y) \ll^? f(g(z),c)$	$f(x,y) \stackrel{.}{=}^? f(g(z),c)$
$\{x \mapsto g(z), y \mapsto c\}$	$\{x \mapsto g(z), y \mapsto c\}$
$f(x,y) \ll^? f(g(z),x)$	$f(x,y) \doteq^? f(g(z),x)$
$\{x\mapsto g(z),y\mapsto x\}$	$\{x \mapsto g(z), y \mapsto g(z)\}$
$f(x,a) \ll^? f(b,y)$	$f(x,a) \doteq f(b,y)$
No matcher	$\{x\mapsto b,y\mapsto a\}$
$f(x,x) \ll^? f(x,a)$	$f(x,x) \doteq^? f(x,a)$
No matcher	$\{x \mapsto a\}$
$x \ll^? f(x)$	$x \doteq f(x)$
$\{x \mapsto f(x)\}$	No unifier

# How to Solve Matching Problems

- $s \doteq ?t$  and  $s \ll ?t$  coincide, if t is ground.
- When t is not ground in  $s \ll^? t$ , simply regard all variables in t as constants and use the unification algorithm.
- Alternatively, modify the rules in  ${\cal U}$  to work directly with the matching problem.

Temur Kutsia – MUG – July 19-20, 2012

# Matching with ${\cal M}$

In order to match s to t

**1** Create an initial system  $\{s \ll^? t\}; \varnothing$ .

2 Apply successively the rules from  $\mathcal{M}$ .

# Matching with $\mathcal{M}$

### Example

Match f(x, f(a, x)) to f(g(a), f(a, g(a))):

$$\{f(x, f(a, x)) \ll^? f(g(a), f(a, g(a)))\}; \varnothing \Longrightarrow_{\text{Decomposition}}$$

$$\{x \ll^? g(a), f(a, x) \ll^? f(a, g(a))\}; \varnothing \Longrightarrow_{\text{Elimination}}$$

$$\{f(a, x) \ll^? f(a, g(a))\}; \{x \ll g(a)\} \Longrightarrow_{\text{Decomposition}}$$

$$\{a \ll^? a, x \ll^? g(a)\}; \{x \ll g(a)\} \Longrightarrow_{\text{Decomposition}}$$

$$\{x \ll^? g(a)\}; \{x \ll g(a)\} \Longrightarrow_{\text{Merge}}$$

$$\varnothing; \{x \ll g(a)\}$$

Matcher:  $\{x \mapsto g(a)\}.$

# Matching with ${\cal M}$

### Example

Match f(x,x) to f(x,a):

$$\{f(x,x) \ll^? f(x,a)\}; \varnothing \Longrightarrow_{\text{Decomposition}} \{x \ll^? x, x \ll^? a\}; \varnothing \Longrightarrow_{\text{Elimination}} \{x \ll^? a\}; \{x \ll x\} \Longrightarrow_{\text{Merging Clash}} \bot$$

No matcher.

# Properties of $\mathcal{M}$ : Termination

#### **Theorem**

For any finite set of matching problems P, every sequence of transformations in  $\mathcal{M}$  of the form  $P; \varnothing \Longrightarrow P_1; S_1 \Longrightarrow P_2; S_2 \Longrightarrow \cdots$  terminates either with  $\bot$  or with  $\varnothing; S$ , with S in matched form.

#### Proof.

- Termination is obvious, since every rule strictly decreases the size of the first component of the matching system.
- ullet A rule can always be applied to a system with non-empty P.
- The only systems to which no rule can be applied are  $\bot$  and  $\varnothing; S$ .
- Whenever  $x \ll t$  is added to S, there is no other equation  $x \ll t'$  in S. Hence,  $S_1, S_2, \ldots$  are in matched form.

Matching
Improving the Unification Algorithm

# Properties of M: Correctness

The following lemma is straightforward:

#### Lemma

For any transformation of matching systems  $P; S \Longrightarrow \Gamma$ , a substitution  $\vartheta$  is a matcher for P; S iff it is a matcher for  $\Gamma$ .

# Properties of $\mathcal{M}$ : Correctness

### Theorem (Soundness)

If  $P; \varnothing \Longrightarrow^+ \varnothing; S$ , then  $\sigma_S$  solves all matching equations in P.

#### Proof.

By induction on the length of derivations, using the previous lemma and the fact that  $\sigma_S$  solves the matching problems in S.

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification Unification
Matching
Improving the Unification Algorithm

# Properties of $\mathcal{M}$ : Correctness

Let  $v(\{s_1 \ll t_1, \ldots, s_n \ll t_n\})$  be  $vars(\{s_1, \ldots, s_n\})$ .

#### Theorem (Completeness)

If  $\vartheta$  is a matcher of P, then any maximal sequence of transformations  $P; \varnothing \Longrightarrow \cdots$  ends in a system  $\varnothing; S$  such that  $\sigma_S = \vartheta|_{v(P)}$ .

#### Proof.

Such a sequence must end in  $\emptyset; S$  where  $\vartheta$  is a matcher of S. v(S) = v(P). For every equation  $x \ll t \in S$ , either t = x or  $x \mapsto t \in \sigma_S$ . Therefore, for any such x,  $x\sigma_S = t = x\vartheta$ . Hence,  $\sigma_S = \vartheta|_{v(P)}$ .

#### Corollary

If P has no matchers, then any maximal sequence of transformations from  $P; \varnothing \text{ must have the form } P; \varnothing \Longrightarrow \cdots \Longrightarrow \bot.$

Motivation Preliminaries Syntactic Unification Unification
Matching
Improving the Unification Algorithm

# Unification via $\mathcal{U}$ : Exponential in Time and Space

### Example

Unifying s and t, where

$$s = h(x_1, x_2, \dots, x_n, f(y_0, y_0), f(y_1, y_1), \dots, f(y_{n-1}, y_{n-1}), y_n)$$
  
$$t = h(f(x_0, x_0), f(x_1, x_1), \dots, f(x_{n-1}, x_{n-1}), y_1, y_2, \dots, y_n, x_n)$$

will create an mgu where each  $x_i$  and each  $y_i$  is bound to a term with  $2^{i+1}-1$  symbols:

$$\{x_1 \mapsto f(x_0, x_0), x_2 \mapsto f(f(x_0, x_0), f(x_0, x_0)), \dots, y_0 \mapsto x_0, y_1 \mapsto f(x_0, x_0), y_2 \mapsto f(f(x_0, x_0), f(x_0, x_0)), \dots \}$$

Can we do better?

# Unification via $\mathcal{U}$ : Exponential in Time and Space

First idea: Use triangular substitutions.

#### Example

Triangular unifier of s and t from the previous example:

$$[y_0 \mapsto x_0; y_n \mapsto f(y_{n-1}, y_{n-1}); y_{n-1} \mapsto f(y_{n-2}, y_{n-2}); \dots]$$

- Triangular unifiers are not larger than the original problem.
- However, it is not enough to rescue the algorithm:
  - Substitutions have to be applied to terms in the problem, that leads to duplication of subterms.
  - In the example, unifying  $x_n$  and  $y_n$ , which by then are bound to terms with  $2^{n+1}-1$  symbols, will lead to exponential number of decompositions.

Matching
Improving the Unification Algorithm

# Unification via $\mathcal{U}$ : Exponential in Time and Space

- Problem: Duplicate occurrences of the same variable cause the explosion in the size of terms.
- Fix: Represent terms as graphs which share subterms.

#### Term Dag

A term dag is a directed acyclic graph such that

- its nodes are labeled with function symbols or variables,
- its outgoing edges from any node are ordered,
- outdegree of any node labeled with a symbol f is equal to the arity of f,
- nodes labeled with variables have outdegree 0.

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification Unification
Matching
Improving the Unification Algorithm

# Term Dags

- Convention: Nodes and terms the term dags represent will not be distinguished.
- Example: "node" f(a,x) is a node labeled with f and having two arcs to a and to x.

The only difference between various dags representing the same term is the amount of structure sharing between subterms.

#### Example

Three representations of the term f(g(a,x),g(a,x)):

して

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification Unification
Matching
Improving the Unification Algorithm

### Term Dags

- It is possible to build a dag with unique, shared variables for a given term in  $O(n * \log(n))$  where n is the number of symbols in the term.
- There are subtle variations that can improve this result to O(n).
- Assumption for the algorithm we plan to consider:
  - The input is a term dag representing the two terms to be unified, with unique, shared occurrences of all variables.

Representing substitutions involving only subterms of a term dag:

- Directly by a relation on the nodes of the dag, either
  - stored explicitly as a list of pairs, or
  - by storing a link ("substitution arcs") in the graph itself, and maintaining a list of variables (nodes) bound by the substitution.

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification Unification
Matching
Improving the Unification Algorithm

### Term Dags

Substitution application.

• Implicit: Identifies two nodes connected with a substitution arc, without actually moving any of the subterm links.

#### Example

A term dag for the terms f(x,g(a)) and f(g(y),g(y)), with the implicit application of their mgu  $\{x\mapsto g(a),y\mapsto a\}$ .

• With implicit application, the binding for a variable can be determined by traversing the graph depth first, left to right.

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification Unification
Matching
Improving the Unification Algorithm

# Improvement 1: Linear Space, Exponential Time

#### Assumptions:

- Dags consist of nodes.
- Any node in a given dag defines a unique subdag (consisting of the nodes which can be reached from this node), and thus a unique subterm.
- Two different types of nodes: variable nodes and function nodes.
- Information at function nodes:
  - The name of the function symbol.
  - The arity n of this symbol.
  - The list (of length n) of successor nodes (corresponds to the argument list of the function)
- Both function and variable nodes may be equipped with one extra pointer (dashed arrow in diagrams) to another node.

## Auxiliary procedures for Unification on Term Dags

#### • Find:

Takes a node of a dag as input, and follows the additional pointers until it reaches a node without such a pointer. This node is the output of Find.

#### Example

- Find(3)=(3)
- Find(2) = (3)

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification Unification
Matching
Improving the Unification Algorithm

# Why is it Quadratic?

- The algorithm is quadratic in the number of symbols in original terms:
  - Each call of Unify2 either returns immediately, or makes one more node unreachable for the Find operation.
  - Therefore, there can be only linearly many calls of Unify2.
  - Quadratic complexity comes from the fact that Occur and Find operations are linear.

#### Improvement 3. Almost Linear Algorithm

How to eliminate two sources of nonlinearity of Unify2?

- Occur: Just omit the occur check during the execution of the algorithm.
  - Consequence: The data structure may contain cycles.
  - Since the occur-check failures are not detected immediately, at the end an extra check has to be performed to find out whether the generated structure is cyclic or not.
  - Detecting cycles in a directed graph can be done by linear search.
- Find: Use more efficient union-find algorithm from

R. Tarjan.

Efficiency of a good but not linear set union algorithm.

J. ACM, 22(2):215-225, 1975.

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Syntactic Unification

Improving the Unification Algorithm

## Auxiliary Procedures for the Almost Linear Algorithm

- Collapsing-find:
  - Like Find it takes a node k of a dag as input, and follows the additional pointers until the node Find(k) is reached.
  - In addition, Collapsing-find relocates the pointer of all the nodes reached during this process to Find(k).

#### Example

• 
$$CF(3)=(3)$$

• 
$$CF(2)=(3)$$

$$f_{(1)} \qquad f_{(4)}$$

$$x_{(2)} \qquad a_{(3)} \qquad y_{(5)}$$

#### Auxiliary Procedures for the Almost Linear Algorithm

- Union-with-weight:
  - Takes as input a pair of nodes u, v that do not have additional pointers.
  - If the set  $\{k \mid \text{Find}(k) = u\}$  larger than the set  $\{k \mid \text{Find}(k) = v\}$  then it creates an additional pointer from v to u.
  - Otherwise, it creates an additional pointer from u to v.
  - Hence, the link is created from the smaller tree to the larger one, increasing the path to the root (the result of Find) for fewer nodes.

Weighted union does not apply when we have a variable node and a function node.

Temur Kutsia – MUG – July 19-20, 2012

ISR 2012 - Universitat Politècnica de València - 16-20 July 2012

Motivation Preliminaries Syntactic Unification Unification
Matching
Improving the Unification Algorithm

#### Almost Linear Algorithm

One more auxiliary procedure:

- Not-cyclic:
  - Takes a node k as input, and tests the graph which can be reached from k for cycles.
  - The test is performed on the virtual graph expressed by the additional pointer structure, i.e. one first applies Collapsing-find to all nodes that are reached during the test.

#### Almost Linear Algorithm

**Input**: A pair of nodes  $k_1$  and  $k_2$  in a directed graph.

**Output**: True if  $k_1$  and  $k_2$  correspond unifiable terms. False Otherwise.

Side Effect: A pointer structure which allows to read off an mgu and the unified term.

Unify3  $(k_1, k_2)$ if Cyclic-unify  $(k_1, k_2)$  and Not-Cyclic  $(k_1)$  then return True else return False end

Improving the Unification Algorithm

#### Almost Linear Algorithm

```
else
```

```
\begin{split} n := & \operatorname{arity}(\operatorname{function-symbol}(u)); \\ (u_1, \dots, u_n) := & \operatorname{succ-list}(u); \\ (v_1, \dots, v_n) := & \operatorname{succ-list}(v); \\ i := 0; & \operatorname{bool}:= & \operatorname{True}; \\ & \operatorname{Union-with-weight}(\mathbf{u}, \mathbf{v}); \\ & \operatorname{while}\ i \leq n\ \text{ and } bool\ \operatorname{do}\\ & i := i+1; \\ & \operatorname{bool}:= & \operatorname{Cyclic-unify}(\operatorname{Collapsing-find}(u_i)\\ & \qquad & \operatorname{Collapsing-find}(v_i)); \qquad /*\ \operatorname{Decomposition}\ */\ \operatorname{end}\\ & \operatorname{return}\ bool \end{split}
```

Procedure Cyclic-unify. Finished.

## Almost Linear Algorithm

The algorithm is very similar to the one described in Gerard Huet's thesis:

G. Huet.

Résolution d'Équations dans des Langages d'ordre  $1, 2, \ldots, \omega$ . Thèse d'État, Université de Paris VII, 1976.

Syntactic Unification

Matching Improving the Unification Algorithm

## Complexity

- The algorithm is almost linear in the number of symbols in original terms:
  - Each call of Cyclic-unify either returns immediately, or makes one more node unreachable for the Collapsing-find operation.
  - Therefore, there can be only linearly many calls of Cyclic-unify.
  - A sequence of n Collapsing-find and Union-with-weight operations can be done in  $O(n * \alpha(n))$  time, where  $\alpha$  is an extremely slowly growing function (functional inverse of Ackerman's function) never exceeding 5 for practical input.
  - The use of nonoptimal Union can increase the time complexity at most by a summand O(m) where m is the number of different variable nodes.
  - Therefore, complexity of Cyclic-unify is  $O(n * \alpha(n))$ .
  - Complexity of Not-cyclic is linear.
  - Hence, complexity of Unify3 is  $O(n * \alpha(n))$ .

## Implementation: Matching vs. Unification

- Unlike matching, efficient unification algorithms require sophisticated data structures.
- When efficiency is an issue, matching should be implemented separately from unification.
